## E250P SPECIFICATIONS

| Amplifier Power (RMS): | 250 Watts |
| :--- | :--- |
| Peak Dynamic Power *: | 550 Watts |
| Driver: | $12^{\prime \prime}(305 \mathrm{~mm})$ PolyPlas $^{\mathrm{TM}}$ |
| Inputs: | Line Level (switchable to LFE) and Speaker |
|  | Level with $5-$ way binding posts |
| Low-Pass Frequency: | Variable from 50 Hz to 150 Hz |
| Frequency Response: | 25 Hz - Low-pass crossover setting |
| Dimensions (H x W x D): | $19-3 / 4 " \times 14-3 / 8 \mathrm{ln} \times 16-1 / 2 \mathrm{~m}$ |
|  | $(502 \mathrm{~mm} \times 365 \mathrm{~mm} \times 419 \mathrm{~mm})$ |
| Weight: | $43 \mathrm{lb} / 19.5 \mathrm{~kg}$ |

Weight: 43 lb/19.5kg

JBL continually strives to update and improve existing products, as well as create new ones. The specifications and details in this and related JBL publications are therefore subject to change without notice.

[^0]
## SAFETY INFORMATION

## Warning

Any person performing service of this unit will be exposed to hazardous voltages and the risk of electric shock. It is assumed that any person who removes the amplifier from this cabinet has been properly trained in protecting against avoidable injury and shock. Therefore, any service procedures are to be performed by qualified service personal ONLY!

## Caution

Early revisions of the unit did not have a power switch. Hazardous voltages are resent within the unit whenever it is plugged in.

Before amplifier is plugged in, be sure its rated voltage corresponds to the voltage of the AC power source to be used. Incorrect voltage could cause damage to the amplifier when the AC power cord is plugged in. Do not exceed rated voltage by more than $10 \%$ : operation below $90 \%$ of rated voltage will cause poor performance or may shut the unit off.

## Leakage/Resistance Check

Before returning the unit to the customer, perform a leakage or resistance test as follows:

Leakage Current. Note there is no power switch on early revisions of this unit. When the power plug is plugged in, the unit is live. Connect the unit to its rated power source. Using an ammeter, measure the current between the neutral side of the AC supply and chassis ground of the unit under test. If leakage current exceeds 0.5 mA , the unit is defective. Reverse the polarity of the AC supply and repeat.

Resistance. Measure the resistance from either side of the line cord to chassis ground, If it is less than 500k ohms, the unit is defective.

WARNING! DO NOT return the unit to the customer if it fails one of these tests until the problem is located and corrected.

## Critical Components

All components identified with the IEC symbol in the parts list and schematic diagram designate components in which safety can be of special significance when replacing identified with. Use only the replacement parts designated in the parts list or parts with the same rating of resistance, wattage or voltage.

## List of Safety Components Requiring Exact Replacements

| Part Number/ Designator | Description |
| :---: | :---: |
| $\begin{array}{\|l\|} \hline \text { F1 } \\ 093-105202-300 \end{array}$ | Line Fuse Slo Blo 2.0A $5 \times 20 \mathrm{~mm}$ |
| 083-041802-009 | 250V UL approved SPT-2 or better with polarized plug, UL approved wired with the hot side to fused side. Use with factory replacement panel strain relief (70305) only. |
| $\begin{aligned} & \text { PT1 } \\ & \text { 042-010053-003 } \end{aligned}$ | Power Transformer. Use only factory replacement. |
| $\begin{aligned} & \hline \text { BR1 } \\ & 052-400080-000 \end{aligned}$ | Bridge diode. Use only factory replacement. |
| $\begin{array}{\|l\|} \mathrm{C} 6,8 \\ 034-330780-300 \end{array}$ | 3300 uF 80 V electrolytic filter caps. Be sure replacement part is at least the same working voltage and capacitance rating. Also the lead spacing is important. Incorrect spacing may cause premature failure due to internal cabinet pressure and vibration. |
| 063-531808-000 | Rear Amp Cover Use only factory replacement |
| $\begin{array}{\|l\|} \hline \text { Inductor } \\ 043-560200-000 \end{array}$ | L1 - Use only factory replacement |
| Inductor 043-300101-000 | L2 - Use only factory replacement |
| $\begin{array}{\|l\|} \hline \text { Inductor } \\ 043-700101-000 \end{array}$ | L3 - Use only factory replacement |
| $\begin{array}{\|l\|} \hline \text { Inductor } \\ 043-324300-000 \end{array}$ | L4 - Use only factory replacement |

|  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Parameter | Specification | Unit | QA Test Limits | Conditions | Notes |
| Turn-on Transient | 50 | mV-peak | 2v-pp | @ Speaker Outputs | AC Line cycled from OFF to ON |
| Turn-off Transient | 50 | mV-peak | 2v-pp | @ Speaker Outputs | AC Line cycled from ON to OFF |
|  |  |  |  |  |  |
| Efficiency |  |  |  |  |  |
| Efficiency | 65 | \% | 64 |  | Nominal Line voltage 120 VAC |
| Stand-by Input Power | 24 | Watts | 26 | @ nom. line voltage | Maximum allowable input power under nominal Input voltage and frequency, HOT or COLD operation. |
| Power Cons. @ rated power | 234 | Watts | 240 | @ nom. line voltage | 150 Watts @ 5.6 Ohms nominal line voltage |
|  |  |  |  |  |  |
| Protections |  |  |  |  |  |
| Short Circuit Protection | YES |  | functional | Direct short at output | Amplifier should resume operation after short circuit condition removal |
| Thermal Protection | YES |  | functional | @1/8 max unclipped Power at 1.06 times the input voltage | Temperature rise in accessible metal parts should not exceed 35 K rise for domestic version or 30K rise for European versions (refer to requirements sheet). |
| DC Offset Protection | YES |  | - | DC present at Speaker Out leads | Design must insure no Offset at the speaker output under any operating condition including abnormal operation |
| Line Fuse Rating |  |  |  |  |  |
| USA-Domestic | 2 | Amps | 2 | Type-T or Slo Blo-250 V | Internal fuse with UL/SEMKO rated holder |
| EU | 1.25 | Amps | 1.25 | Type-T or Slo Blo-250 V, Low Breaking capacity | Internal fuse with UL/SEMKO rated holder |
|  |  |  |  |  |  |
| 4. ALL SPECS SHOULD BE MEASURED AT NOMINAL LINE VOLTAGE. |  |  |  |  |  |

## SPEAKERCONNECTION

When we designed the E150P and E250P powered subw oofers, our goal was to offer the user the best possible performance combined with the most flexible and complete installation options. Please look over the following three examples to determine which description best matches your system and follow the corresponding hookup instructions.

To use the binding-post speaker terminals with bare wire, unscrew the collar until the hole through the center post is visible under the collar. Insert the bare end of the wire
through the hole in the post, then screw the collar back down until the connection is tight. The holes in the center of the collars are intended for banana-type connectors. Speakers and electronics terminals have corresponding positive ( + ) and negative (-) terminals. It is important to connect both speakers identically: positive (+) on the speaker to positive (+) on the amplifier and negative (-) on the speaker to negative (-) on the amplifier Wiring "out of phase" results in thin sound, weak bass and a poor stereo image.

NOTE: The speaker-level connection method described on the next page is not a preferred connection and should only be resorted to if your receiver/ processor does not have a line-level or subw oofer output. The customer is responsible for proper connections, and any damage to J BL or other equipment due to improper connections will not be covered by your J BL warranty. Consult with your J BL dealer or an audioinstallation expert if you have any questions about how to connect your subw oofer using the speaker-level inputs.

## Analog Receiver/Processor - Speaker-Level Connections

Use this installation method only with an analog receiver/ processor that does not have digital processing or bass management, and also does not have a subw oofer output or a volume-controlled preamp (line-) level output:
Connect the speaker wires for both your main left and right speakers, and for the subwoofer, to the same speaker terminals on your receiver or amplifier. The wires may be joined by twisting together the bare ends of the two leads that will be connected to each terminal on the receiver/ amplifier, as shown in the diagram. This procedure should be done only four times (involving a total of eight barewire ends), and only for those wire ends that are being connected to the terminals on your receiver/amplifier. It is important that you avoid joining any other wires. Do not tw ist together wire ends that are being inserted into terminals on any speaker or on the subw oofer. Do not twist together wire ends that will be used for any speakers other than the front left and right speakers or the subwoofer. Refer to the connection diagram for guidance.
Tw ist together the ( + ) leads at one end of the speaker wires that you have designated for the left front speaker and for
the left high-level inputs on the subwoofer. Insert the joined (tw isted) wires into the left front ( + ) terminal on your receiver/amplifier. Connect the free end of the ( + ) lead for the left front speaker to the ( + ) terminal on the back of the speaker. Connect the free end of the ( + ) lead for the left input on the subw oofer to the left binding-post terminal. Repeat this process for the (-) connections for the left front

To (+) terminal on left speaker
To (+) terminal of left
input on subwoofer

To front left
(+) terminal on receiver/amplifier

## Analog Receiver/Processor - Line-Level Connections

Use this installation method with an analog receiver/ processor that does not have digital processing or bass management, and that is equipped with a full-range subwoofer output or a volumecontrolled preamp (line-) level output:
Use RCA-type interconnect cables to connect the linelevel subw oofer outputs on your receiver or amplifier to the line-level inputs on the subw oofer.
IM PORTANT: M ake sure that the LFE toggle switch on the subwoofer is in the "Normal" position. Do not use the "LFE" position with Dolby* Pro Logic*-only processors.
Note: If your receiver or amplifier has only one subwoofer output jack, then you
may connect the subwoofer output on your receiver/preamplifier to either the left or right line-level input on the subw oofer. It makes no difference which jack you choose. Connect each speaker to the corresponding speaker terminals on your receiver or amplifier. M ake sure your receiver or processor is configured so that the subwoofer is "On."
Note for advanced users: If your receiver/ processor has a built-in lowpass crossover filter for the subw oofer output, then the LFE switch should be set to the "LFE" position to bypass the subw oofer's internal
 crossover.

## Digital Receiver/Processor - LFE Connection

Use this installation method for Dolby Digital, DTS ${ }^{*}$ or other digital surround processors that have bass-management programming, or for analog receivers/processors that have a filtered subw oofer output:
IM PORTANT: $M$ ake sure that the LFE toggle switch on the subw oofer is in the "LFE" position. Use the line-level input jacks for the LowFrequency Effects channel. Connect these jacks to the LFE output or subw oofer output on your receiver or amplifier.
Note: If your receiver or amplifier has only one subw oofer output jack, you may connect the subwoofer output on your receiver/preamplifier to either
the left or right line-level input on the subw oofer. It makes no difference which jack you choose.
Connect each speaker to the corresponding speaker terminals on your receiver or amplifier.
M ake sure that you have configured your surround sound processor for receverpreampufier "Subwoofer On" or "LFE On." The front, center and surround speakers should be set to "Small" or "Large" depending on their size and frequency response. Consult your receiver's or processor's owner's manual.

## OPERATION

## Power

When the unit is plugged in and the power switch is on and no signal is received, the LED on the top of the unit will turn red. When a signal is present, the LED w ill turn green.

Note: It will take several minutes for the LED to turn from green to red after the input signal to the subwoofer is removed. Due to J BL's unique high-output, high-efficiency amplifier design, power con-
sumption is minimal when the subwoofer is not receiving a signal. Of course, the subwoofer can be turned off, whenever desired, if you do not wish to leave it in auto (standby) mode.

## Level Control

The subw oofer Level Control adjusts the volume of the subw oofer relative to the rest of the system. Proper level adjustment depends on several variables such as room
size, subw oofer placement, type of main speakers and position. Adjust the subw oofer level so that the volume of the bass information is pleasing to you.

## Crossover Adjustments

The Crossover Frequency Control determines the highest frequency at which the subwoofer reproduces sounds. If your main speakers can comfortably reproduce some lowfrequency sounds, set this control to a lower frequency setting, betw een 50 Hz and 100 Hz . This will concentrate the subw oofer's efforts on the ultradeep bass sounds required by today's films and music. If you are using smaller bookshelf speakers that do not extend to the lower bass frequencies, set the low-pass crossover control to a higher setting, betw een 120 Hz and 150 Hz . This control is not used when the LFE switch is in the "LFE" position.

## Phase Control

$0^{\circ}$
 Phase

The Phase Control determines whether the subw oofer's pis-ton-like action moves in and out in phase with the main speakers or opposite the main speakers. There is no correct or incorrect setting. Proper phase adjustment depends on several variables such as subw oofer placement and listener position. Adjust the phase switch to maximize
bass output at the listening position.

Remember, every system, room and listener is different. There are no right or wrong settings; this switch offers the added flexibility to adjust your subw oofer for optimum performance for your specific listening conditions without having to move your speakers.

If at some time in the future you happen to rearrange your listening room and move your speakers, you should experiment with the phase switch in both positions, and leave it in the position that maximizes bass performance.

## TROUBLESHOOTING

If you used the high-level (speaker) inputs and there is no sound from any of the speakers:

- Check that the receiver/ amplifier is on and a source is playing.
- Check that the powered subw oofer is plugged into an active electrical outlet and is switched on.
- Check all wires and connections betw een the receiver/ amplifier and the speakers. Make sure all wires are connected. Make sure none of the speaker wires are frayed, cut or punctured, or touching each other, except for the wires for the front left and right speakers, which may be joined with the wires for the subw oofer at the receiver/ amplifier end only, if you are using the speaker-level connections as described on page 4.
- Review proper operation of your receiver/amplifier.

## If there is low (or no) bass output:

-M ake sure the connections to the left and right "Speaker Inputs" have the correct polarity (+ and -).

- M ake sure that the subwoofer is plugged into an active electrical outlet and switched on.
- Adjust the crossover point.
- Flip the Phase Control switch to the opposite position.
- If you are using a Dolby Digital/DTS receiver or processor, make sure that the subw oofer adjustments on the receiver/processor are set up correctly.
- Slowly turn the Level Control clockw ise until you begin to hear the desired amount of bass.

## If you used the line-level inputs and there is no sound from the subw oofer:

- Check that the receiver/ amplifier is on and a source is playing.
- Check that the powered subwoofer is plugged into an active electrical outlet and is switched on.
- Check all wires and connections between the receiver/amplifier and the subw oofer. Make sure all wires are connected. Make sure none of the wires are frayed, cut or punctured, or touching each other.
- Review proper operation of your receiver/amplifier.
- Slowly turn the Level Control clockw ise until you begin to hear the desired amount of bass.
- M ake sure that you have configured your receiver/ processor so that the subwoofer/LFE output is on.

## TEST SET-UP AND PROCEDURE

## General Function

## UUT = Unit Under Test

1) Connect one line level input cable (RCA) from signal generator to either Right or Left Level input on UUT. LEVEL control should be full counterclockwise (MIN). Make sure the LFE/Normal switch is in the NORMAL position.
2) Turn on generator, adjust to $\mathbf{1 0 0 m V}, 50 \mathrm{~Hz}$.
3) Plug in UUT; Turn Main Power switch ON. LED's on the top panel may be either Red or Green. Turn LEVEL control full clockwise (MAX). Low Pass control should be set fully clockwise (150Hz).
4) LED should turn Green; immediately bass response should be heard and felt from port tube opening.
5) Turn off generator, turn LEVEL control fully counterclockwise (MIN), disconnect RCA cables.
6) Connect one pair of speaker cables to either high level input terminal on UUT. Cables should be connected to an integrated amplifier fed by the signal generator.
7) Turn on generator and adjust so that speaker level output is $1.0 \mathrm{~V}, \mathbf{5 0 H z}$. Turn LEVEL control full clockwise (MAX).
8) Green LED should light, immediate bass response should be heard and felt from the port tube opening.

## Sweep Function

1) Follow steps $1-4$ above, using a sweep generator as a signal source.
2) Sweep generator from 20 Hz to 300 Hz . Listen to the cabinet and drivers for any rattles, clicks, buzzes or any other noises. If any unusual noises are heard, remove driver and test.

## Driver Function

1) Remove driver from cabinet; detach + and - wire clips.
2) Check DC resistance of driver; it should be 4.8 ohms.
3) Connect a pair of speaker cables to driver terminals. Cables should be connected to an integrated amplifier fed by a signal generator and adjust so that speaker level output is 5.0 V .
4) Sweep generator from 20 Hz to 1 kHz . Listen to driver for any rubbing, buzzing, or other unusual noises.
$-\quad-\quad 2$

## TECH TIPS

Troubleshooting tips and solutions to common service problems
For models: E150P,E250P and PB10,PB12 (Revision 2) *
TIP\# JBLTT2003-04 Rev1

Subject: Replacing MOSFETS Q18, Q22

In the event you need to replace MOSFET transistors Q18 or Q22 as part of a repair, it is important to use

ONLY the JBL part\# FE106401110 or only the brands: International Rectifier, or Fairchild.

Replace both Q18 and Q22 MOSFET's in the circuit, even if only one seems to be damaged.

Do NOT mix \& match these components from different manufacturers, or batches. They should be identical.

* Late version PB10 or PB12 subwoofers (Revision 2 in the service manual) can be identified by:
- Amplifier serial number starts with "HA"
- Output transistors in the open, on a large black heatsink
- Large plastic cup enclosing the rear of the amp assembly
- Main PCB, bottom, solder-side contains all SMD devices

## DETAILED TROUBLESHOOTING

## A. Power Amp Section

| Resistance Check | Resistance from S+ (SPK O/P) to GND should be >1M $\Omega$ (NO LOAD) |
| :---: | :---: |
|  | Resistance from V+ (C6 P+) to V- (C8 P-) gradually Fully CHARGED should read >10k $\Omega$ |
|  | Resistance from V+ (C6 P+) to S+ (SPK O/P) should read $>1 \mathrm{M} \Omega$ |
|  | Resistance from V- (C8 P-) to S+ (SPK O/P) should read $>1 \mathrm{M} \Omega$ |

## 2. Power Up LED RED

With a 5 mV signal to Low level input, LED should change to GREEN
-Voltage measurements (DVM)

| LED | OP AMP |  |

[^0]:    * The Peak Dynamic Power is measured by recording the highest center-to-peak voltage measured across the output of a resistive load equal to minimum impedance of the transducer, using a 50 Hz sine wave burst, 3 cycles on, 17 cycles off.
