## INSTRUCTION MANUAL MODEL 242 REGULATED HIGH VOLTAGE SUPPLY

## WARRANTY

We warrant each of our products to be free from defects in material and workmanship. Our obligation under this warranty is to repair or replace any instrument or part thereof (except tubes and batteries) which, within a year after shipment, proves defective upon examination. We will pay domestic surface freight costs.

To exercise this warranty, call your local field representative or the factory, DDD 216. 795-2666. You will be given assistance and shipping instructions.

## REPAIRS AND RECALIBRATION

Keithley Instruments maintains a complete repair service and standards laboratory in Cleveland, and has an authorized field repair facility in Los Angeles.
To insure prompt repair or recalibration service, please contact your local field representative or the plant directly before returning the instrument.
Estimates for repairs, normal recalibrations, and calibrations traceable to the National Bureau of Standards are available upon request.

## SECTION 1. GENERAL DESCRIPTION

1-1. GENERAL. The Keithley Model 242 Regulated High Voltage Supply provides accurate, stable outputs between 300 and 3500 volts dc. Accuracy is $\pm 0.1 \%$ for all loads up to 25 milliamperes. Stability is $\pm 0.01 \%$ for six months after a 30 -minute warm-up. Line regulation is within $\pm 0.005 \%$ for a $10 \%$ change in line voltage, and load regulation is within $\pm 0.005 \%$ from zero to full load.

## 1-2. FEATURES.

a. Four in-line calibrated dials set the output voltage in l-volt steps. A TRIM Control interpolates between steps with resolution better than 15 millivolts. Output can be selected positive or negative, or floated up to 1000 volts off chassis ground.
b. Cumulative drift is prevented by a chopper circuit with a temperature-compensated zener diode reference, a photo-modulator comparator and wirewound sampling resistors.
c. The Model 242 uses heavy duty thermionic rectifiers, a maintenance-free photo-modulator and epoxy encapsulated power transformers. All high voltage capacitors are of oilfilled, metal-cased construction with mylar dielectric.

1-3. APPLICATIONS. The Model 242 is an excellent source for phototubes, photo-multiplier tubes and other detectors requiring high voltage biasing with superior stability. Its current capability permits parallel operation of photo-multiplier divider strings. Other applications include use in calibration tests, voltage gradient studies, insulation tests and leakage resistance measurements.

FIGURE 1. Keithley Instruments Model 242 Regulated High Voltage Supply. The Voltage Supply is shown with the Model 2421 End Frames, for bench use.

## 1-4. SPECIFICAIIONS.

OUTPUT:
Voltage: 300 to 3500 volts dc in 1-volt steps.
Current: 25 milliamperes dc maximum.
Polarity: Positive or negative.
Floating: 1000 volts maximum off chassis ground.
ACCURACY: $\quad \pm 0.1 \%$ of dial setting.
RESOLUTION: A TRIM Control permits interpolation between steps with a resolution of better than 15 millivolts.

RESETABILITY: $\pm 0.01 \%$.
STABILITY: $\pm 0.01 \%$ per 6 months after a 30 -minute warm-up.
TEMPERATURE COEFFICIENT: $\pm 15 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ maximum.
LINE REGULATION: $\pm 0.005 \%$ for $10 \%$ change in line voltage.
LOAD REGULATION: $\pm 0.005 \%$ from zero to full load.
RIPPLE AND NOISE: Less than 2 millivolts rms above 5 cps.
OVERLOAD PROTECTION: Output is disconnected within 25 miliiseconds if current exceeds approximately $27 \mathrm{milliamperes}$.

CONNECTORS: Output: Two Teflon-insulated hn type. Ground: Binding post.
POWER: $105-125$ volts, $50-60 \mathrm{cps}, 250$ watts. $210-250$ volt models available.
DIMENSIONS, WEIGHT: 7 inches high x 19 inches wide $\times 13-1 / 4$ inches deep; net weight, 39 pounds.

ACCESSORIES SUPPLIED: Mating connectors.
1-5. ACCESSORIES. The Model 242 is designed for rack mounting and requires the Model 2421 End Frames for bench use. The pair of end frames, which comes with feet and mounting hardware, fastens to the Voltage Supply sides and front panel.

1-6. EQUIPMENT RECEIVED. The Model 242 Voltage Supply is factory calibrated. Two vacuum tubes, the 7235 (V4, Figure 10) and the 4-65A (V12, Figure 8) are packed separately to prevent damage during shipping. Both output receptacles are capped, one with a red shorting cap and the other with a plain protective cap. The shipping carton also contains the Instruction Manual and two mating output plugs.

NOTE

Before shipping the Model 242, always remove tubes V8 and V12. Pack these separately to prevent damage during shipping.

## SECTION 2. OPERATION

## 2-1. FRONT PANEL CONTROLS AND TERMINALS (See Figure 2).

a. Voltage Switches. Four skirted dials, calibrated in $1000,100,10$ and l-volt steps, set the output voltage from 300 to 3500 volts dc.
b. TRIM Contro1. The TRIM Control extrapolates between l-volt settings with a resolution to 15 millivolts. The span of the control is 1.5 volts.
c. POWER Switch. A toggle switch energizes the filament and low voltage supplies to the Model 242. When the Switch is ON, the POWER pilot light will glow green to indicate the instrument is on. The Fuse for the control circuits is next to the Switch.
d. HIGH VOLTAGE Switch. A toggle switch controls the high voltage output circuits and also resets the High Voltage Supply after an overload. The amber pilot light indicates the HIGH VOLTACE Switch is ON. When the Switch is off, the high voltage output is disconnected, although the filament and low voltage circuits continue operating. The Fuse for the high voltage circuit is next to the Switch.
e. OUTPUT Receptacles. Two hn-type receptacles (UG $496 / \mathrm{U}$ ) are on the front panel, marked for negative ( - ) and positive ( + ) outputs with respect to the chassis. The ground post (GND) is between the receptacles. The red cap is a shorting cap to ground the unused receptacle during normal operation. The other cap protects the receptacle when the Model 242 is not operating.
f. OVERLOAD Pilot Light. When the output current exceeds approximately 27 milliamperes, the overload relay opens the high voltage output circuit and lights the red OVERLOAD PIlot Light. The Pilot Light also lights for settings below 300 volts.

FIGURE 2, Model 242 Front Panel Controls and Terminals. Circuit designations refer to Replaceable Parts List and the schematic diagram.

2-2. OPERATING PROCEDURES.
a. Keep the POWER Switch, HIGH VOLTAGE Switch and TRIM Control off. Connect the power cord at the back of the cabinet to an outlet. Unless otherwise specified on the instrument, the Model 242 connects into $105-125$ volt, $50-60$ cps sources.
b. Connect the load to the Model 242. For positive polarity output, connect the cable to the + OUTPUT Receptacle; connect the red shorting cap to the - OUTPUT Receptacle to ground the negative line. The + OUTPUT Receptacle has its center terminal at positive polarity and its shell at chassis ground. Reverse procedures for negative polarity output.
c. Set the POWER Switch to ON, Select the output voltage by setting the four Voltage Switches between 300 and 3,500 volts.

NOTE
Make sure the TRIM Control is set to OFF. If it is on, up to 1.5 volts will be added to the displayed output.
d. Warm up the Model 242 for 30 seconds. Put the HIGH VOLTAGE Switch in ON position. Warm up the Mode1 242 for approximately 30 minutes for maximum output stability.

NOTE
The OVERLOAD Pilot Light will light if the HIGH VOLTAGE Switch is ON when the POWER Switch is turned on, OVERLOAD will also light if the circuits are not warmed up. When the OVERLOAD bulb lights, put the HIGH VOLTAGE Switch off and wait 30 seconds. Then put on HIGH VOLTAGE Switch again.
e. If desired, use the TRIM Control for settings between the l-volt steps. Resolution is better than 15 millivolts.
f. When resetting output voltage or changing terminals, put the HIGH VOLTAGE Switch to OFF position. The POWER Switch can remain on as long as the HIGH VOLTAGE Switch is off for the output change. Only the green light should be on for this step.

2-3. OVERLOADS. If the red OVERLOAD Pilot Light lights, the circuit is overloaded and the output is disconnected. To reset the Model 242 , snap the HIGH VOLTAGE Switch off, wait 30 seconds, then put it on again. Refer to Section 4 if the OVERLOAD Pilot Light continues to light.

2-4. FLOATING OPERATION. Remove the shorting cap from the receptacle. Connect two separate shielded coaxial cables, type RG-149/U or equivalent, to the OUTPU' Receptacles, one for positive and one for negative polarity. Use only the two furnished connectors and the specified shielded cables because of the high potentials present.

NOTE

Do not float the Voltage Supply more than 1000 volts off chassis ground. Because of the high voltages present, make sure all instructions are understood and followed before attempting floating operations.

## SECTION 3. CIRCUIT DESCRIPTION

3-1. GENERAL. The Keithley Model 242 Regulated High Voltage Supply furnishes accurate, stable outputs from 300 to 3500 volts dc. The block diagram, Figure 3, shows the relationship between the operating circuits. Setting the sampling resistors in the divider selects the output voltage. The maintenancefree photo-modulator compares a portion of the output to the zener diode reference. The difference is amplified and used to control the series regulator tube. This maintains the output voltage constant at a level determined by the divider ratio selected with the front panel Voltage Switches.

NOTE
Refer to Schematic Diagram 14661D for circuit designations.

3-2. AC CONTROL CIRCUITS. (Refer to Figure 4.)
a. Closing the POWER Switch, S1, com-
 pletes the circuit from the power line to transformer Tl, which furnishes the bias voltages, and to filament transformer T3. If the HIGH VOLTAGE Switch, 54 , is off, the control relay, K2, will close. The circuit to transformer T2, which supplies high voltages to the series regulator, can now operate when the HIGH VOLTAGE Switch is turned on.
b. If the HIGH VOLTAGE Switch is already ON when the POWER Switch is put ON, the circuit activating the control relay is open. Therefore, transformer T2 can not function, even though the other two transformers are operating.
c. The Model 242 has several safety devices in its ac control circuits. The over-

FIGURE 3. Model 242 Block Diagram.

FIGURE 4. Simplified Diagram of AC Control Circuits. All circuits are shown open. Circuit designations refer to schematic digram. load relay, K1, breaks the circuit to the control relay and to transformer T2 if the output current exceeds approximately 27 milliamperes. The decade interlocks, S 5 and S 6 , will not close for outputs less than 300 volts.

3-3. LOW AND HIGH VOLTAGE SUPPLIES.
a. Transformer Tl supplies low voltages to bias the circuits and to furnish the voltage for the zener diode reference. A separate winding, along with tube V9, provides regulated 105 volts to the screen of the series regulator tube, V12. The transformer also provides
the gating voltage for the diode bridge demodulator, D106 to D109.
b. Transformer T2 supplies the high voltages for the series regulator. The transformer primary is tapped to furnish a different voltage for each 1000 -volt range. This prevents exceeding the voltage and power rating of the series regulator, V12, under any of the specified line and load conditions. Two rectifiers, tubes V10 and V11, convert the transformer output to full-wave rectified dc for the series regulator, V12.

3-4. REGULATOR CIRCUIT. (See Figure 5.)
a. The regulator circuit uses a photomodulator to compare the output voltage to the selected voltage. Any difference is amplified and returned to the series regulator to correct the output.
b. For low-frequency fluctuations at the output, the voltage divider and the sampling resistors on the decade switches divide the output voltage. The photo-modulator, E101, compares the reference voltage across zener diode D103 and the divided output voltage. The photo-modulator develops an ac signal for any dc voltage difference. The signal is then amplified by tube V2 and demodulated by the diode bridge, D106 to D109. The dc signal is further amplified by V3 and V4 and applied to the bias of the series regulator tube, V12.
c. For high-frequency fluctuations and transients in the output, the feedback loop is through capacitor C120 to the grid of tube V4, which applies the signal to the bias of the series regulator tube, V12.
d. The voltage switching is done by current sensing, which means no switch contact is required to carry more than 5 milliamperes or switch more than 9 volts.

## SECTION 4. SERVICING

4-1. GENERAL. Section 4 contains the maintenance and troubleshooting procedures for the Model 242 Voltage Supply. Follow these as closely as possible to maintain the specifications of the instrument.

4-2. SERVICING SCHEDULE. The Model 242 requires no periodic maintenance beyond the normal care required of high-quality electronic equipment. Occasional checks of the output, described in Section 5, will show the need for any adjustments. No part should need frequent replacement under ordinary use.

## 4-3. PARTS REPLACEMENT.

a. The Replaceable Parts List in Section 6 describes the electrical components of the Voltage Supply, Replace components only as necessary. Use only reliable replacements which meet the specifications.
b. The zener diode, D103, is selected. Diodes D104 and D105 are matched; replace only as a pair. Order these replacements only from Keithley Instruments, Inc., or its representative, as well as other parts marked for Keithley manufacture in the Replaceable Parts List.

4-4. TROUBLESHOOTING.
a. The procedures which follow give instructions for repairing troubles which might occur in the Model 242. Use the procedures outlined and use only specified replacement parts. Table 1 lists equipment recommended for troubleshooting. If the trouble cannot be located or repaired, contact Keithley Instruments, Inc., or its representative.

Keithley Instruments Model 153 MicrovoltAmmeter, $1 \%$ accuracy at 100 millivolts

Tektronix Type 503 Oscilloscope, $1 \mathrm{mv} / \mathrm{cm}$ sensitivity, dc to 450 kc
dc voltmeter, $10 \%$ accuracy, to 4000 volts,
10-megohm minimum input resistance
Grid-modulated tube tester
10-ohm, $1 / 2$ watt, $1 / 2 \%$ deposited carbon resistor (Keithley Part Rl2-10)

NE-1 neon tube; $1 / 2$ watt, $1 / 2 \%$ deposited carbon resistor; 0.5 -microfarad, 4000 -volt capacitor

Zener circuit adjustment

Adjust bias

Measure dc voltages

Test vacuum tubes
Zener circuit adjustment

Adjust bias

TABLE 1. Equipment Recommended for Model 242 Troubleshooting. Use these instruments or their equivalents.

| Trouble | Probable Cause | Remedy |
| :---: | :---: | :---: |
| No output | Blown fuse, FI or F2 | Replace fuse; if fuse again blows, check further |
|  | Defective V10, V11, R113 or C106 | See paragraph 4-6 |
|  | Defective series regulator V12 | See paragraph 4*6 |
| Output voltage not stable | Defective C115 | Check capacitor; replace if faulty |
| Output voltage not accurate | Power Supply out of calibration | Recalibrate per paragraph 5-3 |
|  | Improper zener adjustment | See paragraph 4-7 |
| Excessive noise in output | Bias out of adjustment | See paragraph 4-8 |
| Overload circuits cuts off with no overload | Defective R118 or K1 | See paragraph 4-9 |
|  | Defective C11.5 | Check capacitor; replace if faulty |
| Voltage Supply operates even when overloaded | C116 shorted | Check capacitor; replace if faulty |

TABLE 2. Model 242 Troubleshooting. Read paragraph 4-5 before performing any repairs.
b. Table 2 lists problems which might occur. If the repair indicated does not work, check through each circuit as described in the following paragraphs. Refer to the circuit description in Section 3 to find the more crucial components and to determine their function. The complete circuit diagram, 14661D, is in Section 6.

4-5. PROCEDURES TO GUIDE TROUBLESHOOTING.
a. Before troubleshooting the Voltage Supply, check the external circuits. Check the fuse, power cord and power source. The Schematic Diagram indicates the tube element voltages referenced to chassis ground. Measure the dc voltages to $\pm 10 \%$ of the indicated values.
b. Check the vacuum tubes. Normally, replacing tubes will clear up any difficulty. A11 tubes except V4, V10, V11 and V12 are readily tested on a grid-modulated tube tester. Check the remaining four tubes by replacing them.

## NOTE

Before removing the top or bottom cover, make sure the power cord is disconnected. After removing the cover, discharge all metal-cased capacitors before proceeding with repairs. Discharge all high voltages through a bleeder.
c. Remove the Model 242 covers. Do not put a load on the instrument. Put the red
shorting cap on the - OUTPUT Receptacle. Set the Voltage Switches for a 300 -volt output; make sure the TRIM Control is off. Put on the POWER and HIGH VOLTAGE Switches, as outlined in paragraph 2-2.

## NOTE

Be careful working inside the chassis. If the POWER Switch is on, up to 200 volts may appear at points in the control circuits. High voltage appears on both sides of the chassis. Before working on a faulty Voltage Supply, disconnect the power cord and discharge all filter capacitors, as C106 and C115.

## 4-6. CORRECTING FOR NO OUTPUT.

a. Check both front panel fuses. The HIGH VOLTAGE Pilot Light indicates when it is possible to have a high voltage output; however, it can light even when the fuse is blown. Replace defective fuses. If the fuse again blows, check further for the cause.
b. Measure the plate voltage of series regulator tube V12. Use a de voltmeter which measures to 4000 volts. Make sure the Voltage Switches are set at 300 volts before making this measurement. The plate voltage should be 2000 volts $\pm 20 \%$.

NOTE
Discharge high voltage from tube V12 through a bleeder. Discharging the cap directly to the chassis may damage resistor R113 or diode D101.
c. If the plate voltage is not correct, check rectifiers V10 and V11, the series resistor R113 (Figure 11), the filter capacitor C106 (Figure 8) and the primary winding of transformer T 2 (Figure 8) for 117 volts ac. If no voltage appears on the transformer primary, check the overload relay, Kl (Figure 10), and the control relay, K2 (Figure 8).
d. If the plate voltage of tube V12 is correct, check the cathode voltage across pin 1 or 7 to ground. The voltage should be 300 volts $\pm 10 \%$.
e. Incorrect voltage at the cathode indicates tube V12 is faulty or incorrect biasing conditions exist. If the voltage is still not correct after tube V12 is replaced, check tube V4 (Figure 10), the dc amplifier tube V3 (Figure 10), the ac amplifier tube V2 (Figure 10), and the diodes in the demodulating bridge, D106 to D109 (Figure 10).
f. If the plate voltage of V12 is correct, check the overload relay K1. Refer to paragraph 4-9.

4-7. CORRECTING FOR INACCURATE VOLTAGE OUTPUT. Poor regulation or excessive drift will affect the accuracy of the voltage output. Several factors cause this; check the following.
a. A defective capacitor Cll5 (Figure 8) will cause the output to be unstable.
b. Although it normally does not need replacement, check the zener diode D103 (Figure 8). Since adjusting the diode circuit requires recalibrating the entire instrument, check the zener difode only after all other possible trouble sources are eliminated.

1. Remove the jumper in series with diode D103 (the jumper is next to R133, Figure 9).

Connect a 10 -ohm, $1 / 2 \%$ resistor (Keithley Part No. R12-10) at this point. Read the voltage across the resistor with the Mode1 153. Adjust the ZENER ADJ potentiometer, R133 (Figure 9), until the microvoltmeter reads the product of the rated zener current ( 7.5 mililamperes) times the resistance ( 10 ohms) or 75 millivolts $\mathbb{\pm}_{1} \%$.
2. The voltage across the zener diode should now be between 8.55 and 9.45 volts. If this voltage is not correct, check the regulator tube V1 (Figure 10), resistor R132 (Figure 11), the ZENER ADJ potentiometer R133 and the zener diode D103.
3. After adjusting the voltage, recalibrate the Model 242 (paragraph 5-3).

4-8. BIAS ADJÚSIMENT.
a. Connect the Model 242 to the circuit shown in Figure 6. Use a resistor which will allow a full load - 25 milliamperes - on the Model 242. For example, set the Voltage Supply to 1000 volts output and use a $25-\mathrm{kil}$ ohm resistor. Use a 0.5 -microfarad, 4000-volt blocking capacitor in series with the oscilloscope for protection.
b. Turn the Voltage Supply on; monitor the output on the oscilloscope. The oscilloscope should show a signal with 2 -millivolt rms ripple or less. Adjust. the BIAS ADJ potentiometer, R144 (Figure 9), until the minimum ripple appears on the oscilloscope.

FIGURE 6. Circuit Diagram for Model 242 Bias Adjustment. Refer to paragraph 4-8 for procedures and Table 1 for equipment.
c. If the potentiometer does not have sufficient range to lessen the noise, check capacitor C108. If capacitor C108 (Figure 10) is open, it will cause excessive noise. If it is good, observe the output wave. A high level of corona indicates the feedback capacitor C120 (Figure 9) is open or the core of transformer T2 (Figure 8) is grounded.

## 4-9. IMPROPERLY WORKING OVERLOAD.

a. If the OVERLOAD Lamp keeps lighting when the instrument is turned on, turn it off and remove the load. If the instrument works when the load is not present, the overload is in the external circuit. If the instrument continues to show an overload, check the Model 242 for the trouble. Check the circuit voltages against those marked on the Schematic Diagram.
b. If the overload relay K1 (Figure 10) will not break the circuit when the Voltage Supply becomes overloaded, check filter capacitor Cl16 (Figure 10) for a short and check the overload relay for proper operation.
c. If the overload relay cuts off the circuit with no overload present, check the coil of Kl (Figure 10) against the rated value printed on it. Also check the shunting resistance R118 (Figure 9) to make sure its value has not changed.
d. If previous checks have not located the source, check capacitor C115 (Figure 8). A leaky or shorted capacitor here will cause troubles similar to those caused by a faulty overload circuit.

## SECTION 5. CALIBRATION

5-1. GENERAL.
a. The following procedures are recommended for calibrating the Model 242, It is also recommended that the equipment listed in Table 3 be used. If difficulty is encountered, contact Keithley Instruments, Inc., or its representative.
b. This Section covers calibrating the accuracy of the output voltage.
c. If the instrument is not within specifications after the calibration, follow the troubleshooting procedures or contact Keithley Instruments, Inc., or its representative.

5-2. CALIBRATION SCHEDULE. Check the accuracy of the output voltage every six months. Also recalibrate the instrument if the series regulator tube, V12, is replaced. Replacing or adjusting the zener diode, D103, also necessitates recalibrating the output.

5-3. OUTPUT CALIBRATION.
a. Set up the Model 242 according to Figure 7. Use the Model 660A Guarded dc Differential Voltmeter ( $\pm 0.02 \%$ 1imit of error) and the Model 6601 A Divider ( $\pm 0.01 \%$ 1imit of error). Total limit of error of this system is $\pm 0.03 \%$. The Model 660A Differential Voltmeter may be used directly for output voltages from 300 to 500 volts.
b. Turn on the Model 242. Set the output to 3500 volts; make sure the TRIM Control is off before making the calibration. The voltmeter should read 3500 volts $\pm 3.5$ volts. If necessary, adjust the HV ADJ potentiometer, R136 (Figure 9), until the output reads 3500 volts on the Model 660A Voltmeter.

## CAUTION

Be careful making internal adjustments. Up to 5000 volts dc and 3600 volts ac are present inside the instrument.
c. Set the Voltage Switches to 300 volts. The voltmeter should read 300 volts $\pm 0.3$ volt. If necessary, adjust the $L V A D J$ potentiometer, R142 (Figure 9), until the output reads 300 volts on the Model 660A Voltmeter.
Instrument Use

Keithley Instruments Model 660A Guarded dc Differential Voltmeter, $\pm 0.02 \%$ limit of error, 100 millivolts to 500 volts

Keithley Instruments Model 6601A Voltage Divider, $100: 1,100$ volts to 5000 volts, $\pm 0.01 \%$ accuracy

TABLE 3. Equipment Recommended for Model 242 Calibration. Use these instruments or their equivalents.
d. Repeat the 3500 and 300 -volt adjustments until there is no discrepency between the Model 242 output setting and the Model 660A. Voltmeter reading.

FIGURE 7. Block Diagram for Calibrating Model 242 Output Accuracy. See Table 3 for equi.pment. Use coaxial cable to connect the Models 242 and 6601A.

| Contro1 | Circuit <br> Desig. | Fig. <br> Ref. | Refer to <br> Paragraph |
| :--- | :--- | :--- | :--- |
| Zener Adjustment | R133 | 9 | $4-7$ |
| High Voltage Adjustment | R136 | 9 | $5-3$ |
| Low Voltage Adjustment | R142 | 9 | $5-3$ |
| Bias Adjustment | R144 | 9 | $4-8$ |

TABLE 4. Mode1 242 Internal Controls. The Table lists all internal controls, the figure picturing the location and the paragraph describing the adjustment.

FIGURE 8. Top View of Model 242 Chassis. The illustration shows the location of components and printed circuit. Refer to Figure 9 for a bottom view.

FIGURE 9. Bottom View of Mode1 242 Chassis. The illustration shows the location of components and internal controls. Refer to Figure 8 for a top view.

FIGURE 10. Tube, Diode, Capacitor and Modulator Locations on Printed Circuit Board PC-100. Resistors are shown in Figure 11.

FIGURE 11. Resistor Locations on Printed Circuit Board PC-100. Other components are shown in Figure 10.

## SECTION 6. REPLACEABLE PARTS

6-1. REPLACEABLE PARTS LIST. The Replaceable Parts List describes the components of the Model 242 Regulated High Voltage Supply. The List gives the circuit designation, the part description, a suggested manufacturer, the manufacturer's part number and the Keithley Part Number. The last column indicates the figure picturing the part. The name and address of the manufacturers listed in the "Mfg. Code" column are contained in Table 6 .

6-2. HOW TO ORDER PARTS.
a. For parts orders, include the instrument's model and serial number, the Keithley Part Number, the circuit designation and a description of the part. All structural parts and those parts coded for Keithley manufacture (80164) must be ordered from Keithley Instruments, Inc., or its representative. In ordering a part not listed in the Replaceable Parts List, completely describe the part, its function and its location.
b. Order parts through your nearest Keithley representative or the Sales Service Department, Keithley Instruments, Inc.
