Model 220 Programmable Current Source Instruction Manual

## WARRANTY

Keithley Instruments, Inc. warrants this product to be free from defects in material and workmanship for a period of 1 year from date of shipment.

Keithley Instruments, Inc. warrants the following items for 90 days from the date of shipment: probes, cables, rechargeable batteries, diskettes, and documentation.

During the warranty period, we will, at our option, either repair or replace any product that proves to be defective.

To exercise this warranty, write or call your local Keithley representative, or contact Keithley headquarters in Cleveland, Ohio. You will be given prompt assistance and return instructions. Send the product, transportation prepaid, to the indicated service facility. Repairs will be made and the product returned, transportation prepaid. Repaired or replaced products are warranted for the balance of the original warranty period, or at least 90 days.

## LIMITATION OF WARRANTY

This warranty does not apply to defects resulting from product modification without Keithley's express written consent, or misuse of any product or part. This warranty also does not apply to fuses, software, non-rechargeable batteries, damage from battery leakage, or problems arising from normal wear or failure to follow instructions.

THIS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE. THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES.

NEITHER KEITHLEY INSTRUMENTS, INC. NOR ANY OF ITS EMPLOYEES SHALL BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OF ITS INSTRUMENTS AND SOFTWARE EVEN IF KEITHLEY INSTRUMENTS, INC., HAS BEEN ADVISED IN ADVANCE OF THE POSSIBILITY OF SUCH DAMAGES. SUCH EXCLUDED DAMAGES SHALL INCLUDE, BUT ARE NOT LIMITED TO: COSTS OF REMOVAL AND INSTALLATION, LOSSES SUSTAINED AS THE RESULT OF INJURY TO ANY PERSON, OR DAMAGE TO PROPERTY.

# Model 220 Programmable Current Source Instruction Manual 

## Manual Print History

The print history shown below lists the printing dates of all Revisions and Addenda created for this manual. The Revision Level letter increases alphabetically as the manual undergoes subsequent updates. Addenda, which are released between Revisions, contain important change information that the user should incorporate immediately into the manual. Addenda are numbered sequentially. When a new Revision is created, all Addenda associated with the previous Revision of the manual are incorporated into the new Revision of the manual. Each new Revision includes a revised copy of this print history page.
Revision G (Document Number 220-901-01)

Revision H (Document Number 220-901-01) ................................................. August 2000

## Safety Precautions

The following safety precautions should be observed before using this product and any associated instrumentation. Although some instruments and accessories would normally be used with nonhazardous voltages, there are situations where hazardous conditions may be present.

This product is intended for use by qualified personnel who recognize shock hazards and are familiar with the safety precautions required to avoid possible injury. Read the operating information carefully before using the product.

The types of product users are:
Responsible body is the individual or group responsible for the use and maintenance of equipment, for ensuring that the equipment is operated within its specifications and operating limits, and for ensuring that operators are adequately trained.

Operators use the product for its intended function. They must be trained in electrical safety procedures and proper use of the instrument. They must be protected from electric shock and contact with hazardous live circuits.

Maintenance personnel perform routine procedures on the product to keep it operating, for example, setting the line voltage or replacing consumable materials. Maintenance procedures are described in the manual. The procedures explicitly state if the operator may perform them. Otherwise, they should be performed only by service personnel.

Service personnel are trained to work on live circuits, and perform safe installations and repairs of products. Only properly trained service personnel may perform installation and service procedures.

Exercise extreme caution when a shock hazard is present. Lethal voltage may be present on cable connector jacks or test fixtures. The American National Standards Institute (ANSI) states that a shock hazard exists when voltage levels greater than 30 V RMS, 42.4 V peak, or 60 VDC are present. A good safety practice is to expect that hazardous voltage is present in any unknown circuit before measuring.

Users of this product must be protected from electric shock at all times. The responsible body must ensure that users are prevented access and/or insulated from every connection point. In some cases, connections must be exposed to potential human contact. Product users in these circumstances must be trained to protect themselves from the risk of electric shock. If the circuit is capable of operating at or above 1000 volts, no conductive part of the circuit may be exposed.

As described in the Intemational Electrotechnical Commission (IEC) Standard IEC 664, digital multimeter measuring circuits (e.g., Keithley Models 175A, 199, 2000, 2001, 2002, and 2010) are Installation Category II. All other instruments' signal terminals are Installation Category I and must not be connected to mains.

Do not connect switching cards directly to unlimited power circuits. They are intended to be used with impedance limited sources. NEVER connect switching cards directly to AC mains. When connecting sources to switching cards, install protective devices to limit fault current and voltage to the card.

Before operating an instrument, make sure the line cord is connected to a properly grounded power receptacle. Inspect the connecting cables, test leads, and jumpers for possible wear, cracks, or breaks before each use.

For maximum safety, do not touch the product, test cables, or any other instruments while power is applied to the circuit under test. ALWAYS remove power from the entire test system and discharge any capacitors before: connecting or disconnecting cables or jumpers, installing or removing switching cards, or making internal changes, such as installing or removing jumpers.

Do not touch any object that could provide a current path to the common side of the circuit under test or power line (earth) ground. Always make measurements with dry hands while standing on a dry, insulated surface capable of withstanding the voltage being measured.

The instrument and accessories must be used in accordance with its specifications and operating instructions or the safety of the equipment may be impaired.

Do not exceed the maximum signal levels of the instruments and accessories, as defined in the specifications and operating information, and as shown on the instrument or test fixture panels, or switching card.

When fuses are used in a product, replace with same type and rating for continued protection against fire hazard.

Chassis connections must only be used as shield connections for measuring circuits, NOT as safety earth ground connections.

If you are using a test fixture, keep the lid closed while power is applied to the device under test. Safe operation requires the use of a lid interlock.

If a $\xlongequal{1}$ screw is present, connect it to safety earth ground using the wire recommended in the user documentation.

The $\$ symbol on an instrument indicates that the user should refer to the operating instructions located in the manual.
The symbol on an instrument shows that it can source or measure 1000 volts or more, including the combined effect of normal and common mode voltages. Use standard safety precautions to avoid personal contact with these voltages.

The WARNING heading in a manual explains dangers that might result in personal injury or death. Always read the associated information very carefully before performing the indicated procedure.

The CAUTION heading in a manual explains hazards that could damage the instrument. Such damage may invalidate the warranty.

Instrumentation and accessories shall not be connected to humans.
Before performing any maintenance, disconnect the line cord and all test cables.

To maintain protection from electric shock and fire, replacement components in mains circuits, including the power transformer, test leads, and input jacks, must be purchased from Keithley Instruments. Standard fuses, with applicable national safety approvals, may be used if the rating and type are the same. Other components that are not safety related may be purchased from other suppliers as long as they are equivalent to the original component. (Note that selected parts should be purchased only through Keithley Instruments to maintain accuracy and functionality of the product.) If you are unsure about the applicability of a replacement component, call a Keithley Instruments office for information.

To clean an instrument, use a damp cloth or mild, water based cleaner. Clean the exterior of the instrument only. Do not apply cleaner directly to the instrument or allow liquids to enter or spill on the instrument. Products that consist of a circuit board with no case or chassis (e.g., data acquisition board for installation into a computer) should never require cleaning if handled according to instructions. If the board becomes contaminated and operation is affected, the board should be returned to the factory for proper cleaning/servicing.

## MODEL 220 SPECIFICATIONS

| MODEL 220 CURRENT SOURCE |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RANGE | MAXIMUM OUTPUT | $\begin{aligned} & \text { ACCURACY } \\ & \text { (1 Year) } \\ & 18^{\circ}-28^{\circ} \mathrm{C} \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { STEP } \\ & \text { SIZE } \end{aligned}$ | TEMPERATURE COEFPICIENT $/{ }^{\circ} \mathrm{C}$ $0^{\circ}-18^{\circ} \mathrm{C} \& 28^{\circ}-50^{\circ} \mathrm{C}$ | NOISE (pk-pk of range) | 3dB BANDWIDTH |

| 100 nA | $\pm 199.95 \mathrm{nA}$ | $0.3 \%+100 \mathrm{pA}$ | 50 pA | $0.02 \%+2 \mathrm{pA}$ | 100 ppm | 0.1 Hz to 100 Hz |
| 10 nA | $\pm 19.995 \mathrm{nA}$ | $0.3 \%+10 \mathrm{pA}$ | 5 pA | $0.02 \%+200 \mathrm{fA}$ | 200 ppm | 0.1 Hz to 10 Hz |
| 1 nA | $\pm 1.9995 \mathrm{nA}$ | $0.4 \%+2 \mathrm{pA}$ | 500 fA | $0.02 \%+200 \mathrm{fA}$ | 400 ppm | 0.1 Hz to 10 Hz |

OUTPUT RESISTANCE: $>10^{14} \Omega$ (on inA range).
OUTPUT CAPACITANCE: $<20 \mathrm{pE}$.
LINE REGULATION: $<0.01 \%$ for $A C$ power line changes within specified limits.
voltage Limit: Bipolar, 1 V to 105 V in 1 V programmable steps.
RESPONSE TIME: <3ms to within $0.1 \%$ of programmed change.
TRANSIENT RECOVERYTIME: <3ms to fated accuracy following any change in compliance voltage.
GUARD OUTPUT:
Maximum Load Capacitance: 10 nF .
Maximum Load Current: Absolute total (Output + Guard) not to exceed 105mA.
Accuracy: $\pm 1 \mathrm{mV}$ (excluding output lead voltage drop).
PROGRAM MEMORY:
Number of Locations: 100.
Hange of Dwell Times: 3ms to 999 ,9s.
Accuracy of Dwell Time: $\pm(0.05 \%+200 \mu \mathrm{~s})$.
OUTPUT LOAD: Output load must be non-inductive.
EXTERNAL TRIGGER: TTL-compatible EXTERNAL TRIGGER INPUT and OUTPUT,
OUTPUT CONNECTIONS: Teflon ${ }^{\text {® }}$ insulated 2 -lug triax connector (Specialty Connector \#30JR121-1) for output; five-way binding posts for GUARD, OUTPUT COMMON, and CHASSIS; BNC (chassis isolated) connectors for EXTERNAL TRIGGER INPUT and OUTPUT, Amphenol or Cinch Series 87 IEEE and printed circuit digital I/O port. All connections on rear panel.

## IEEE-488 BUS IMPLEMENTATION

MULTILINE COMMANDS: DCL, LLO, SDC, GET, GTL, UNT, UNL, SPE, SPD.
UNILINE COMMANDS: IFC, REN, EOI, SRQ, ATN.
INTERFACE FUNCTIONS: SH1, AH1, T6, TE0, L4, LE0, SR1, RL1, PP0, DC1, DT1, C0, E1.
INTERNAL PROGRAMMABLE PARAMETERS: Display Mode, Output, Prefix Data Format, EOI, SRQ (including mask for over Limit), Program Mode, Range, Trigger Mode, Terminator Character, Inputs (Source, Limit, Dwell Time, 100 -Point Memory Locations), Output Status, Digital Self Test.
DIGITAL I/O PORT: A separate I/O port consisting of four input and four output lines as well as common (IEEE-488) and +5 V DC. Outputs will drive one TTL load. Inputs represent one TTL load. The 220 or 230 can be programmed to generate an "SRQ" upon any change in the four bit input data. Mating connector supplied.

## GENERAL

DISPLAY: 0.5 in LED digits, $41 / 2$-digit signed mantissa, 1 -digit signed exponent.
SYSTEMS COMPATIBILITY: IEEE-488-1978.
LIMIT INDICATIONS (Voltage Limit): "V-LIMIT" LED will biink.
MAXIMUM ALLOWABLE COMMON MODEVOLTAGE (OUTPUT or OUTPUT COMMON to CHASSIS): 250 V rms, DC to 60 Hz .
SELPTEST: Digital RAM, ROM, front panel LEDs upon power ON.
EMC: Conforms to European Union Directive 89/336/EEC.
SAFETY: Conforms to European Union Directive 73/23/BEC (meets EN61010-1/IEC 1010).
WARM-UP: 1 hour to rated accuracy.
POWER: 105-125 or $210-250 \mathrm{~V}$ AC (internal switch selected), 50 or 60 Hz , 60 W maximum ( 80 VA maximum). $90-105$ or 180-210V AC operation available.
COOLING: Internal fan for forced air cooling.
ENVIRONMENTAL LIMITS: Operating: $0^{\circ}-50^{\circ} \mathrm{C}$; up to $35^{\circ} \mathrm{C}$ at $70 \%$ non-condensing relative humidity. Storage: $-25^{\circ}$ to $70^{\circ} \mathrm{C}$. DIMENSIONS, WEIGHT: 127 mm high $\times 216 \mathrm{~mm}$ wide $\times 359 \mathrm{~mm}$ deep ( $5 \mathrm{in} \times 81 / 2$ in $\times 141 / \mathrm{in}$ ). Net weight $4,4 \mathrm{~kg}(9 \mathrm{lb} 11 \mathrm{oz}$ ). ACCESSORIES SUPPLIED: Model 6011 Triaxial Test Lead ( 3 ft ).

Specifications subject to change without notice.

## SECTION 1 GENERAL INFORMATION

### 1.1 INTRODUCTION

The Model 220 is a programmabie current source with full range current from 2 nA to 100 mA . The Model 220 has a selectable voltage compliance of up to 105 V in one volt increments. The 100 memory locations allow up to 100 storage points for programming source, V-limit, and dwell time. The Model 220 can be used with any measurement system that uses the IEEE-488 interface bus. For detailed operating instructions of the Model 220 and the IEEE-488 bus, refer to the Model 220/230 Programming Manual.

### 1.2 FEATURES

The Model 220 includes the following features:

- 100 point buffer that is capable of storing up to 100 points of an output waveform.
- Programmable dwell time between the data points in the buffer when used in the singie or continuous program modes.
- Input and output connections for external triggering located on the rear panel.
- Selectable voltage compliance allows operator to select the required voltage compliance.
- $41 / 2$ digit display with appropriate exponent and decimal point.
- Program modes that control the sequence between the buffer points. This is for either single, step or continuous sequencing.
- Data keyboard to enter data (V-limit, dwell time, source, etc.) into the buffer.
- Program control that has a start, stop and reset control for the buffer and program mode.
- OPERATE button that holds the source in standby until programmed into operate.
- IEEE-488 interface bus operation is standard. This enables the Model 220 to be incorporated into a system that uses programmed control through the IEEE-488 bus.

### 1.3 WARRANTY INFORMATION

Warranty information is provided on the inside front cover of this manual. If there is a need to exercise the warranty, contact the Keithley representative in your area to determine the proper action to be taken. Keithley maintains complete repair and calibration facilities in the United States, West Germany, Great Britain, France, the Netherlands, Switzerland and Austria. Information concerning the application, operation or service of your instrument may be directed to the applications engineer at any of the above locations. Check the inside front cover of this manual for addresses.

### 1.4 MANUAL ADDENDA

improvements or changes to this manual will be explained on an addendum included with this manual.

### 1.5 SAFETY SYMBOLS AND TERMS

Safety symbols used in this manual are as follows:
The symbol on the instrument denotes that the user should refer to the operating instructions.

The symbol $\qquad$ on the instrument denotes that 1000 V or more may be present on the terminal(s).

The WARNING used in this manual explains dangers that could result in personal injury or death.

The CAUTION used in this manual explains hazards that could damage the instrument.

## 1 . 6 UNPACKING AND INSPECTION

The Model 220 is inspected both mechanically and electrically before shipment. Upon receiving the Model 220 unpack all items from the shipping container and check for any obvious damage that may have occurred during transit. Report any damage to the shipping agent. Retain and use the original packaging materials if reshipment is necessary. The following items are shipped with all Model 220 orders:

- Model 220 Programmable Current Source
- Model 220 Instruction Manual
- Model 6011 Triaxial Test Lead
- Model 220/230 Programming Manual
- Optional accessories per request.

### 1.7 REPACKAGING FOR SHIPMENT

The Model 220 should be packed in its original carton using the packaging method shown in Figure 1-1. Before packaging, wrap the instrument in plastic. After it is placed in the box, surround the instrument with styrofoam packaging material.

If the Model 220 is to be returned to Keithley Instruments for calibration or repair, include the following:
-ATTENTION REPAIR DEPARTMENT on the address label.

- Warranty status of the instrument.
- Completed service form.

### 1.8 SPECIFICATIONS

For Model 220 detailed specifications, refer to the specifications that precede this section.

### 1.9 ACCESSORIES

### 1.9.1 Optional Accessories

The following optional accessories are available from Keithley Instruments to enhance the capabilities of the Model 220.

Model 1019A Universal Rack Mounting Kit-The Model 1019A Universal Rack Mounting Kit can accomodate one or two Model 220's. The dimensions are $133 \mathrm{~mm} \times 483 \mathrm{~mm}$ ( $51 / 4 \mathrm{in} . \times 19 \mathrm{in}$.).

Model 6167 Guarded Adapter-The Model 6167 Guarded Adapter reduces effective cable capacity by driving the inner shield of a triaxial cable at guard potential.

Model 7008-3 IEEE-488 Cable-The Model 7008-3 is a three foot (1 meter) IEEE-488 Cable. The cable has 24 stranded wire conductors and is terminated with IEEE-488 standard connectors.

Model 7008-6 IEEE-488 Cable-The Model 7008-6 is a six foot (2 meter) IEEE-488 Cable. The cable has 24 stranded wire conductors and is terminated with IEEE-488 standard connectors.

Model 7010 Cable Adapter-The Model 7010 is a IEEE-488 cable adapter. The adapter extends the IEEE-488 connector by one connector width for easy access connections.

### 1.9.2 Supplied Accessories

The following accessory is supplied with each Model 220.
Model 6011 Triax Input Cable-The Model 6011 is a three foot ( 1 meter) low noise triax cable terminated with alligator clips at one end and a Teflon ${ }^{\text {® }}$ insulated triax connector at the other end.

Figure 1-1. Instrument Packaging

## SECTION 2 OPERATION

### 2.1 INTRODUCTION

This section includes operating instructions such as: preparation for use, environmental conditions, front and rear panel control descriptions, output connections and several examples of uses and applications of the Model 220. For Model 220 front and rear panel illustrations refer to Figure 2-1.

### 2.2 PREPARATION FOR USE

### 2.2.1 Power-Up

Plug the Model 220 into the proper power receptacle in accordance with Table 2-1. For fuse replacement or line switch (S102) setting refer to the maintenance section.

## WARNING

Ground the instrument through a properly earth grounded receptacle before operation. Failure to ground the instrument can result in severe injury or death in the event of short circuit or malfunction.

Table 2-1. Line Voltage Setting

| Input Voltage | Switch Setting <br> S102 | Fuse (F101) |
| :---: | :---: | :---: |
| $105 \mathrm{~V}-125 \mathrm{~V}$ | 115 VAC | $1 / 2 \mathrm{~A}, 250 \mathrm{~V}, 3 \mathrm{AG}$ |
| $210 \mathrm{~V}-250 \mathrm{~V}$ | 230 VAC | $1 / 4 \mathrm{~A}, 250 \mathrm{~V}, 3 \mathrm{AG}$ |
| $90 \mathrm{~V}-110 \mathrm{~V}^{*}$ | 115 VAC | $1 / 2 \mathrm{~A}, 250 \mathrm{~V}, 3 \mathrm{AG}$ |
| $180 \mathrm{~V}-220 \mathrm{~V}^{*}$ | 230 VAC | $1 / 4 \mathrm{~A}, 250 \mathrm{~V}, 3 \mathrm{AG}$ |

*For instruments equipped with low voltage transformer TR-187.
Immediately after turning on the Model 220 via the power switch, the display will indicate the following for several seconds:

1. This is a display test. The operator can note inoperative display segments by comparing the Model 220's display with the figure above.
2. In addition, the push button and the TALK, LISTEN, REMOTE indicators will light. All indicators will light simultaneously if operating correctly.

After the display test is complete the Model 220 will display the software revision level for approximately one second.

After the software revision level is displayed, the Model 220 will display the primary address of the instrument for approximately one second. The primary address of the Model 220 is factory set at 12.

### 2.2.2 Warm-Up

To achieve rated accuracy the Model 220 requires one hour for warm-up.

### 2.3 OPERATING INSTRUCTIONS

### 2.3.1 Environmental Conditions

Operation of the Model 220 should be at an ambient temperature within the range of $0^{\circ} \mathrm{C}$ to $50^{\circ} \mathrm{C}$, up to $35^{\circ} \mathrm{C}$ at $70 \%$ noncondensing relative humidity. Environmental conditions for storage are from $-25^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$.

### 2.3.2 Front Panel Controls Description

Power On/Off switch operates on the push-push principle. Depressing this button turns the instrument on. Pushing the button again (releasing) turns the instrument off.

Display-There are four operating functions in the display group. They are described as follows.
SOURCE button selects the source data for display. The full scale range of the available source current is 1.9995 nA to 101.00 mA . The source current is displayed as a $41 / 2$ digit number with a single digit exponent. The least significant digit of the $41 / 2$ digit display is truncated to a " 0 " or a " 5 " when the ENTER button is pressed. When a $1,2,3$ or 4 is entered as the least significant digit, it is truncated to a zero when the ENTER button is pressed. When a 6, 7, 8 or 9 is entered as the least significant digit, it is truncated to a five when the ENTER button is pressed.

During the entry of source data onto the display (cursor is flashing), pressing the SOURCE button reverts the display to the previous source data. A different source current can be programmed for each of the 100 memory locations.

V-LIMIT button selects the voltage compliance for display. The compliance voltage ranges from 1 V to 105 V in 1 V increments. The voltage compliance is displayed as a three digit number. The three digit number is right justified when a one or two digit number is entered and the ENTER button is pressed. The voltage compliance limiting is bipolar.

The voltage limit accuracy for output current $\left(I_{\text {out }}\right)$ greater than inA and less than $100 \mu \mathrm{~A}$ is $\pm 3 \%(+0.5 \mathrm{~V})$. For $\mathrm{I}_{\text {out }}$ greater than or equal to $100 \mu \mathrm{~A}$ there is an additional error of $\mathrm{V} V$ in the same

Figure 2-1. Model 220 Front and Rear Panels
polarity of $I_{\text {our }}$. For $I_{\text {out }}$ less than or equal to 1 nA there is an additional error of 0.5 V with the opposite polarity of $I_{\text {out }}$.

A different compliance voltage limit can be programmed for each of the 100 memory locations. During the entry of V-limit data onto the display, (cursor is flashing) pressing the V-LIMIT button reverts the display to the previous V-limit data.
DWELL TIME button selects the dwell time data for display. Dwell time is defined as the programmed time the Model 220 spends on a specific memory location when in the single or continuous program modes. The range of the dwell time is 3 msec to 999.9 sec . The dwell time is displayed as a $4 \frac{1}{2}$ digit number with a single digit exponent. After the data is entered onto the display and the ENTER button is pressed, the exponent is displayed as a -3 or a 0 depending on the data entered. An entry of zero for the dwell time, in any memory location except the first will be interpreted as a reset in the step or continuous program modes to permit short cycling of the programmed memory locations it will be interpreted as a stop in the single program mode. The dwell time accuracy listed in the specifications requires that the IEEE-488 bus to be inactive.
A different dwell time can be programmed for each of the 100 memory locations. During the entry of dwell time data onto the display (cursor is flashing), pressing the DWELL TIME button reverts the display to the previous dwell time data.

MEMORY button selects the present memory location number for display. There are 100 available memory locations. They start at memory location 1 and range up to location 100. The memory location is displayed as a three digit number. The three digit display is right justified when a one or two digit number is enterned onto the display or upon actuation of the RESET button the Model 220 selects memory location 1 as the present memory location.

Each memory location contains the source current data, V-limit data, dwell time data and the number of the memory location. To display any of these parameters contained in a particular memory location simply press the appropriate button leg. SOURCE, V-LIMIT, DWELL. TIME or MEMORY). The data of each of these parameters can vary for each memory location. This means the Model 220 can store up to 100 different values of source current, compliance voltage or dwell time.

During the entry of memory location data onto the display (cursor is flashing), pressing the MEMORY button reverts the display to the previously displayed memory location.

## NOTE

The contents of all the memory locations are lost when the power to the Model 220 is turned off.

Data Entry - The three buttons contained in the data entry group consist of the COPY, ENTER and EXPONENT buttons. The three buttons and their functions are described as follows:
EXPONENT button allows entry of exponent data onto the display. The EXPONENT button is active only in the source and dwell time display modes. Once the single digit exponent
data has been entered onto the display and the ENTER button is pressed, the Model 220 places the data and the exponent into the proper notation. For example, if $520.0-7$ is entered on the display, it is displayed as 52.00-6 after the ENTER button is pressed.
ENTER button loads the displayed data into the present memory location.
COPY button duplicates the source, V-limit, and dwell time data from one memory location into the next memory location. The COPY button is active only in the memory display mode. Refer to example 5.
OUTPUT button is an alternate action control which places the instrument in the displayed output mode. In the operate mode, the OUTPUT LED is turned on and the source data in the present memory location is present at the output connector on the rear panel. When the instrument is not in the operate mode, the output is programmed to $.0000-9 \mathrm{amps}$.

Additionally if the compliance voltage was programmed to $>32 \mathrm{~V}$ it will be reduced (without changing displayed value) to 32 V .

Program Mode - The three buttons contained in the program mode group consist of the SINGLE, CONTINUOUS and STEP buttons. These three buttons select the possible modes of scanning the internal 100 memory locations. The buttons are described as follows:
STEP button selects the step program mode. The step program mode allows the user to manually step through the programmed memory locations using the START/STOP button. When the Model 220 is in the step program mode the STEP LED is turned on.
SINGLE button selects the single program mode. The single program mode cycles through the programmed memory locations one time upon the actuation of the START/STOP button. When the Model 220 is in the single program mode the SINGLE LED is turned on.
CONTINUOUS button selects the continuous program mode. The continuous program mode cycles through the programmed memory locations continuously upon the actuation of the START/STOP button. When the Model 220 is in the continuous program mode the CONTINUOUS LED is turned on.
Program Control-The two buttons contained in the program control group are the RESET and START/STOP buttons. These two buttons control the use of the single, continuous and step program modes. The two buttons are described as follows:

RESET button is a momentary control that sets the presently displayed memory location back to memory location 1. If the Model 220 is in the operate mode, pressing the RESET button sets the output to the source data located in memory location 1. Pressing the RESET button during the entry of data onto the display in the Source, V-limit, dwell time or memory display modes sets the display back to the previous displayed data. Once the data is entered onto the display and the ENTER button is pressed, pressing the RESET button reverts the instrument back to the conditions in memory location 1.

START/STOP button is an alternate action control that serves two functions. The two functions are described as follows:

1. When the START/STOP button is pressed the selected program mode (step, single or continuous) is initiated.
2. When the START/STOP button is pressed a second time the START/STOP and the action of the selected program mode is stopped.
3. The START/STOP LED will be on continuously during the execution of the single of continuous program mode. In the step program mode the LED will be on the duration of the programmed dwell time.

## NOTE

When the instrument is in the standby mode (OPERATE LED is turned off), and either single or continuous programming mode, the START/ STOP button continues to control the buffer with no output present on the Model 220. In the step mode, the START/STOP LED turns on for the duration of the programmed dwell time.
DATA - The 12 buttons in the Data group allow entry of numerical data from 0 to 9 including with decimal point and polarity onto the display.

The TALK, LISTEN and REMOTE LED's identify the present status of the IEEE-488 bus. For more information concerning the Model 220 and the IEEE-488 bus refer to the Model 220/230 Programming Manual.

### 2.3.3 Rear Panel Description

OUTPUT connector is Teflon insulated female triax connector.

GUARD terminal provides a low impedance voltage source which is equal to the output compliance voltage. The maximum load capcitance for the guard output is $0.01 \mu \mathrm{~F}$. The maximum load current which includes guard and output is not to exceed 105 mA . The accuracy of the guard output is $\pm 1 \mathrm{mV}$ excluding output lead IR voltage drops.

## NOTE

The guard voltage will not equal the output voltage when the instrument is at the programmed V-limit overcompliance level.

OUTPUT COMMON terminal provides easy access to output common which is also the inner shield of the output connector.

CHASSIS GROUND terminal provides a convenient connection to chassis ground (earth ground).

IEEE-488 INTERFACE connector provides bus connection to the Model 220. The connector mates with the Model 7008-3 and 7008-6 IEEE cables.*

ADDRESS switches are used to program the primary address for the IEEE-488 interface bus operation. The primary address is updated only upon power-up.*

DIGITAL $1 / O$ port consists of four input and four output lines as well as IEEE-488 common and +5 VDC . The outputs will drive one TTL load. The instrument can be programmed to generate an SRQ upon any change in the 4 bit input data.*

EXTERNAL TRIGGER INPUT initiates the selected program mode in the same manner as the START/STOP button upon receiving a TTL level negative transition with a minimum pulse width of $10 \mu \mathrm{sec}$.

EXTERNAL TRIGGER OUTPUT provides a negative TTL level pulse of greater than $10 \mu \mathrm{sec}$ at the completion of the programmed dwell time.

The line power fuse is rated as shown in Tables 5-2 and 5-3.
The line plug mates with a 3 -wire line cord which provides UL approved connections to line power.
*For more information concerning the IEEE-488 connector, digital I/O port and primary address switches refer to the Model 220/230 Programming Manual.

### 2.3.4 Output Connector

The output connector is a Teflon ${ }^{(1}$ insulated triax connector which is located on the rear panel. The maximum allowabie voltage potential between the HI terminal and the LO terminal is $\pm 100 \mathrm{~V}$. The maximum allowable common mode voltage between the HI input terminal and the chassis common is 250 V rms DC to 60 Hz . See Figure 2-2.

## CAUTION

Do not exceed the maximum common mode voltage. Instrument damage may occur.

Figure 2-2. Output Connector

### 2.3.5 Inductive Loads

In general, the output load connected to the Model 220 should be resistive. However, a small amount of inductance in the load can be tolerated but only if the inductive reaction voltage Ligi is limited to less than 105V. Refer to Figure $2-3$ for a suggested method of limiting the inductive reaction voltage.

## CAUTION

If the output load connected to the Model 220 is inductive, limit the inductive reaction voltage to less than 105 V . Otherwise instrument damage may occur.

Figure 2-3. Limiting Inductive Reaction Voltage

### 2.4 OPERATION OF THE MODEL 220

The Model 220 has several different operating parameters. These parameters (step, single continuous, source, V-limit, dwell time etc) are to be programmed using the following general procedure. Several examples of exact programming are given after the following.

### 2.4.1 Model 220 General Operating Procedure NOTE

Upon power up or upon actuation of the RESET button the Model 220 is set to memory location 1.

1. Turn on the Model $\mathbf{2 2 0}$ and allow one hour for warm up for rated accuracy operation.
2. Select memory location.
A. Press MEMORY.
B. Press the number(s) of the desired memory location (1 to 100).
C. Press ENTER.
3. Program the desired source.
A. Press SOURCE.
B. Press the number(s) of the desired source current $(.0000-9 \mathrm{~mA}$ to 101.00 mA$)$. Note that upon power-up the source is set to $.0000-9$.
C. Press ENTER.
4. Program the appropriate $V$-limit.
A. Press V-limit.
B. Press the number(s) of the appropriate compliance voltage limit ( 1 to 105 V in one volt increments). Upon power-up the V-limit is set to 1 V .
C. Press ENTER.
5. Program the desired dwell time.
A. Press DWELL TIME.
B. Press the number(s) of the appropriate dwell time ( 3 msec to 999.9 sec in 1 msec increments.) Upon powerup the dwell time of memory location 1 is set to 3.000-3 sec.
C. Press ENTER.
6. Select the desired program mode (step, single or continuous).
7. Connect appropriate load.

NOTE
The output load must be noninductive. A small amount of inductance in the load can be tolerated if the inductive reaction voltage Lifit is limited to less than 105V. Refer to paragraph 2.3.5.
8. Program the Output to the operate mode by pressing the OUTPUT button.
9. Select the program control by pressing the START/STOP button.

## NOTE

The output is programmed to $.0000-9$ when not in the operate mode.

### 2.4.2 Examples of Operation

The following examples depict several operating levels and conditions.

Example 1 Error Message - The Model 220 will display an error message if it is programmed into a parameter value that is outside of the range of the instrument. Table 2-2 lists the conditions that cause an error message. For example program the Model 220 for memory location 102.

1. Press MEMORY.
2. Press $1,0,2$.
3. Press ENTER.

After the ENTER button is pressed, the Model 220 displays the following for approximately one second. Then the Model 220 returns to the previous display of the memory location.

Table 2-2. Error Message Conditions

| Parameters | Limits |
| :--- | :--- |
| Source | Greater than 101.00 mA |
| V-Limit | Greater than 105 V or an entry of 000. |
| Dwell time | Greater than 999.9 sec, less than 3 msec. <br> Memory |

Example 2-In this example the Model 220 will be programmed to output a current of 10 mA with a 10 V compliance limit.

Required Output: 10 mA with 10 V compliance.
Use the following procedure to program the Model 220 to output the preceding parameters.

1. Select a memory location, if memory location 1 is not desired.
2. Press SOURCE, 1, 0, EXPONENT, 3, ENTER. (Programs a source value of 10 mA.$)$
3. Press V-LIMIT, 1, 0 , ENTER. (Programs 10 V V-Limit.)
4. Connect load.
5. Press OPERATE.

## NOTE

If the ENTER button is not pressed in the sequence indicated, the display data will not be programmed into the appropriate memory location.

Upon the actuation of step 5 the Model 220 outputs 10 mA with a 10 V compliance limit. Press the SOURCE button to
verify that the 10 mA was actually programmed into the Model 220. Press the V-LIMIT button to verify that the 10 V limit was actually programmed into the Model 220.

Example 3-In this example the Model 220 will be programmed to output three separate currents, three separate compliance limits, three separate dwell times and three separate memory locations. The three memory locations will be programmed in the step program mode.
Required Output: $100 \mu \mathrm{~A}$, 10 V V-limit, 1 second dwell time, memory location 1.
$1 \mathrm{~mA}, 20 \mathrm{~V}$ V-limit, 100 msec dwell time, memory location 2.
$10 \mathrm{~mA}, 30 \mathrm{~V}$ V-limit, 2.5 second dwell time, memory location 3.

1. Press MEMORY, 1, ENTER. (Selects memory location 1.)
2. Press SOURCE, 1, 0, 0, EXPONENT, 6, ENTER. (Programs memory location 1 source for $100 \mu \mathrm{~A}$.)
3. Press V-LIMIT, 1, 0, ENTER. (Programs memory location 1 V-limit for 10 V .)
4. Press DWELL TIME, 1, EXPONENT, 0, ENTER. (Programs memory location 1 dwell time for one second.)
5. Press MEMORY, 2, ENTER (Selects memory location 2.)
6. Press SOURCE, 1, EXPONENT, 3, ENTER. (Programs memory location 2 source for 1 mA .)
7. Press V-LIMIT, 2, 0, ENTER. (Programs memory location 2 V-limit for 20 V .)
8. Press DWELL TIME, $1,0,0$, EXPONENT, $+/-, 3$, ENTER. (Programs memory location 2 dwell time for 100 msec. )
9. Press MEMORY, 3, ENTER. (Selects memory location 3.)
10. Press SOURCE, 1, O, EXPONENT, 3, ENTER. (Programs memory location 3 source for 10 mA .)
11. Press V-LIMIT, 3, 0, ENTER. (Programs memory location 3 V -limit for 30 V .)
12. Press DWELL TIME , 2, ., 5, EXPONENT, 0, ENTER. (Programs memory location 3 dwell time for 2.5sec.)
13. Press STEP. (Selects the step program mode.)

After completing step 13 the Model 220 is programmed into the parameters stated. To display any of the three programmed source values, select the desired source value's memory location and press the SOURCE button. To output any of the three source values select the desired source value's memory location, and press the OUTPUT button. Pressing the START/ STOP button advances the Model 220 to the next channel. Notice that the START/STOP LED turns on for the programmed dwell time and then turns off. Note that actuation of START/STOP at memory location 3 will put instrument to location 1.
Example 4-In this example the Model 220 will be programmed to output five separate currents, five separate compliance limits, five separate dwell times and five separate memory locations.

Required Output: $100 \mathrm{nA}, 5 \mathrm{~V}$ V-limit, 0.5 second dwell time, memory location 1.
$1 \mu \mathrm{~A}, 10 \mathrm{~V}$ V-limit, 1 second dwell time, memory location 2.
$10 \mu \mathrm{~A}, 15 \mathrm{~V}$ - limit, 1.5 second dwell time, memory location 3.
$100 \mu \mathrm{~A}, 20 \mathrm{~V}$ V-limit, 2 second dwell time, memory location 4.
$1 \mathrm{~mA}, 25 \mathrm{~V}$ V-limit, 2.5 second dwell time, memory location 5 .

1. Press MEMORY, 1, ENTER. (Selects memory location 1.)
2. Press SOURCE, 1, 0, 0, EXPONENT, 9, ENTER. (Programs memory location 1 source for 100 nA .)
3. Press V-LIMIT, 5, ENTER. (Programs memory location 1 V -limit for 5 V .)
4. Press DWELL TIME, ., 5, EXPONENT, 0, ENTER. (Programs memory location 1 dwell time for 0.5 seconds.)
5. Press MEMORY, 2, ENTER. (Selects memory location 2.)
6. Press SOURCE, 1, EXPONENT, 6, ENTER. (Programs memory location 2 source for $1 \mu \mathrm{~A}$.)
7. Press V-LIMIT, 1, 0, ENTER. (Programs memory location 2 V-limit for 10 V .)
8. Press DWELL TIME, 1, EXPONENT, 0, ENTER. (Programs memory location 2 dwell time for one second.)
9. Press MEMORY, 3, ENTER. (Selects memory location 3.)
10. Press SOURCE, 1, 0, EXPONENT, 6, ENTER. (Programs memory location 3 source for $10 \mu \mathrm{~A}$.)
11. Press V-LIMIT, 1, 5, ENTER. (Programs memory location 3 V-limit for 15 V .)
12. Press DWELL TIME, 1, ., 5, EXPONENT, 0, ENTER. (Programs memory location 3 dwell time for 1.5 seconds.)
13. Press MEMORY, 4, ENTER. (Selects memory location 4.)
14. Press SOURCE, $1,0,0$, EXPONENT, 6, ENTER. (Programs memory location 4 ssurce for $100 \mu \mathrm{~A}$.)
15. Press V-LIMIT, 2, 0, ENTER. (Programs memory location 4 V -limit for 20 V .)
16. Press DWELL TIME, 2, EXPONENT, 0, ENTER. (Programs memory location 4 dwell time for 2 seconds.)
17. Press MEMORY, 5, ENTER. (Selects memory location 5.)
18. Press SOURCE, 1, EXPONENT, 3, ENTER. (Programs memory location 5 source for 1 mA .)
19. Press V-LIMIT, 2, 5, ENTER. (Programs memory location 5 V-limit for 25 V .)
20. Press DWELL TIME,2, ., 5, EXPONENT, 0, ENTER. (Programs memory location 5 dwell time for 2.5 seconds.)

After completing step 20 the Model 220 is programmed into the parameters stated. To display any of the parameters of any memory location select the desired memory location and then select the desired parameter. To output any of the source values select the desired source value's memory location and press the OUTPUT button.

To scan the five memory locations use the following procedure:

1. Select the program mode of scanning. (Select Single, Continuous, or Step.)
2. Select desired display mode. (Source, V-limit, dwell time or memory.)
3. Press the START/STOP button.

In the step program mode the user can manually step through the programmed memory locations one at a time. Each time it is desired to advance to the next programmed memory location the user presses the START/STOP button. The START/ STOP LED turns on for the duration of the programmed dwell time. When the last programmed memory location is selected (memory location 5 in this example) pressing the START/ STOP button reverts the instrument to memory location 1.
In the single program mode the Model 220 cycles through all the programmed memory locations one time. To start the single program mode press the START/STOP button. Once the single program mode is activated, the Model 220 starts from the present memory location and advances to each programmed memory location. The instrument remains at each memory location for the programmed dwell time and then advances to the next programmed memory location. After the dwell time of the last programmed location the START/STOP LED turns off and the single program mode is ended. The Model 220 remains at the last programmed location until power is turned off, RESET is pressed, memory location is changed or the single or continuous program modes are activated.

## NOTE

An entry of zero for the dwell time for any memory location is interpreted as a reset in the step, single and continuous program modes.

In the continuous program mode the Model 220 cycles through all the programmed memory locations continuously. To start the continuous program mode press the START/ STOP button. To stop the continuous program mode press the START/STOP button a second time. When the START/ STOP button is pressed the second time the continuous program mode is stopped at the present memory location. Once the continuous program mode is activated, the Model 220 starts from the present memory location and advances to the next memory location. The instrument remains at the present memory location for the programmed dwell time (dwell time can vary for each memory location) and then advances to the next memory location. The cycle continues up to and including the last programmed memory location and then reverts to memory location 1. At this point the cycle starts over again and keeps repeating until the START/STOP button is pressed, power to the instrument is turned off or the single or step program modes are selected.

Example 5-In this example the COPY button will be used to duplicate the data of memory location 1 into memory locations 2, 3, 4 and 5 . The COPY button function, when used in the memory display mode, duplicates the source, V-limit, and dwell time data of one memory location, into the next memory location. Program the following parameters into memory location 1 and use the procedure to duplicate these parameters into memory locations 2, 3, 4 and 5.
Required Parameters:

1. 10.05 mA Source
2. 25 V V-limit
3. 525 msec Dwell Time
4. Press MEMORY, 1, ENTER. (Selects memory location 1.)
5. Press SOURCE, 1, $0, \ldots, 5$, EXPONENT, 3, ENTER. (Programs memory location 1 source for 10.05 mA .)
6. Press V-LIMIT, 2, 5, ENTER. (Programs memory location 1 V-limit for 25 V. )
7. Press DWELL TIME, 5, 2, 5, EXPONENT, 3, ENTER. (Programs memory location 1 dwell time for 525 msec .)
8. Press MEMORY, COPY, COPY, COY, COPY.

The parameters specified were programmed into the Model 220 by steps 1 through 4. The parameters of memory location 1 were duplicated into memory locations 2, 3, 4 and 5 by step 5. To verify that the data was duplicated into the other memory locations select each memory location and select each parameter for each memory location. For example: To verify that 10.05 mA was duplicated into memory location 3 use the following two steps.

1. Press MEMORY, 3, ENTER. (Selects memory location 3.)
2. Press SOURCE. (Dispiays memory location 3 source data.)

Example 6 Fabricating Output Waveforms-The Model 220 is capable of fabricating output waveforms. With the 100 memory locations the Model 220 can fabricate waveforms with up to 100 individual steps. The following procedure is an example of programming the Model 220 to output a square wave of 10 mA to 2 mA at 100 Hz .

Required Output: 10 mA to 2 mA square wave at 100 Hz with a $V$-limit of 10 V .

## NOTE

Cycle power to the instrument before starting this example to avoid confusion of previously programmed memory locations.

1. Press MEMORY, 1, ENTER. (Selects memory location 1.)
2. Press SOURCE, 1, 0, EXPONENT, 3, ENTER. (Programs memory location 1 's $V$-limit for 10 V .)
3. Press V-LIMIT, 1, 0, ENTER. (Programs memory location 1's V-limit for 10V.)
4. Press DWELL TIME, 5, EXPONENT, 3, ENTER. (Programs memory location 1 dwell time for 5 msec .)
5. Press MEMORY, 2, ENTER. (Selects memory location 2.1
6. Press SOURCE, 2, EXPONENT, 3, ENTER. (Programs memory location 2 source for 2 mA ).)
7. Press V-LIMIT, 1, 0, ENTER. (Programs memory location 2 V-limit for 10 V .)
8. Press DWELL TIME, 5, $+/-$, EXPONENT, 3, ENTER. (Programs memory location 2 dwell time for 5 msec .)
9. Press CONTINUOUS, OPERATE, START/STOP.

Upon completion of step 9 the Model 220 outputs a 10 mA to 2 mA 100 Hz square wave as shown in Figure 2-4.

## NOTE

When fabricating output waveforms observe the response time specifications of the Model 220. Also, consider the affect of load impedance on the waveform to be fabricated.

Figure 2-4. 10 mA to 2 mA Square Wave

## NOTE

In this example the Model 220 does not change range. If the Model 220 is programmed to change from one range into another (e.g. 10 mA to 1 mA ), the output drops to zero for approximately 2 msec between range changes.

Example 7 Using External Trigger (Input and Output) The external trigger input initiates the program mode (single, continuous, or step) in the same manner as the START button. To output any programmed values the program mode must be selected, the OPERATE button enabled, and the instrument must receive the external trigger input pulse.
The external trigger output is a pulse signifying the completion of a programmed dwell time. The pulse is present at the external trigger output in any of the three program modes. For the single or continuous program modes there is an output pulse at the end of every programmed dwell time. For the step program mode, there is an output at the end of the programmed dwell time for the one memory location. To go on to the next step (memory location), and therefore output another external trigger output pulse, another external trigger input pulse is required.
Using the Model 619 in conjunction with the Model 220 can help illustrate this example. Like the Model 220, the Model 619 has external trigger input and output (electrometer complete and external trigger) lines. Connect the two instruments as shown in Figure 2-5. In this configuration and with the proper programming, the Model 220 will output the programmed current when the START button is pressed. At the end of the specified dwell time the Model 220 outputs the external trigger pulse. This pulse triggers the Model 619 to take a reading. When the Model 619 measurement cycle is completed it will output a trigger pulse (via the electrometer complete line) to the Model 220. The trigger pulse from the Model 619 to the

Model 220, triggers the Model 220 to advance to the next memory location and output the next programmed current.

## NOTE

Only the Model 619's with electrometer complete and external trigger can be used for this example.

At this point the cycle repeats itself and keeps on repeating itself by advancing through the programmed memory locations of the Model 220. To stop the cycle, disconnect one of the trigger lines.

## NOTE

The Model 619 can be set to the talk-only mode and connected to an IEEE compatible printer. The Model 619 measurement data would then be recorded by the printer automatically. This would free the operator from recording the data manually.
Example 8 Using Guard - Leakage resistance between low current conductors and nearby voltage sources can cause significant error currents. For example, if a printed circuit element has a leakage path with a resistance of $10^{9} \Omega$ to a nearby 15 V supply terminal, a current of 15 nA will be generated as shown in Figure 2-6a. In order to keep this current below 1pA, the leakage resistance would have to be above $1.5 \times 10^{12} \Omega$. This high resistance is difficult to maintain in many situations. In order to eliminate such stringent insulation resistance requirements, guarding techniques may be used as shown in Figure 2-6b.
Guarding is surrounding the sensitive input with a conductor (the guard) connected to a low impedance point which is at (virtually) the same potential. The GUARD terminal located on the rear panel provides an easy connection to a low impedance voltage source which is equivalent to the output compliance voltage.
The maximum load capacitance for the guard output is $0.01 \mu \mathrm{~F}$. The maximum load current which includes guard and output is not to exceed 105mA. The accuracy of the guard $\pm 1 \mathrm{mV}$ excluding output lead l•R voltage drop.

Example 9 Floating Operation - The Model 220 can be floated off chassis ground. Guard or output common MUST NOT be connected to chassis ground when floating the instrument above chassis ground potential. Chassis ground is connected to earth ground with the line power cord and an appropriate grounded three-wire receptacle. The Model 220 can be floated up to 250 Vrms above chassis ground.

Figure 2-5. Using the Model 220 External Trigger

2-6B. GUARDED CIRCUIT

## Figure 2-6. Guarding <br> CAUTION

When an external voltage source is connected in series with the Model 220 output, care should be taken to limit the power delivered to the Model 220. Refer to Figure 2-8 for power limits.

Example 10 Operation as an Active Load (Current Sink) - The Model 220 can be used as an active current sink as shown in Figure 2-7. The output voltage $\mathrm{V}_{0}$ is a function of $E, I$ and $R_{L}$ where:
$V_{0}=E+R_{L}$
$\mathrm{E}=$ External Voltage Source
I=Programmed Current on the Model 220
$\mathrm{R}_{\mathrm{L}}=$ Load Resistance

## CAUTION

When the Model 220 is connected so as to sink current (that is, power is delivered to the Model 220 by an external power supply), care should be taken to limit the power delivered to the Model 220. Figure 2-8 shows the power limits to the Model 220 used in this configuration.

Figure 2-7. Connections as a Current Sink with Resistive For resistive loads the Model 220 will deliver the programmed current up to the compliance voltage ( $\mathrm{V}_{\mathrm{o}}=\mathrm{V}_{\mathrm{c}}$ ). The output voltage $V_{0}$ must be within the power limits specified in Figure 2-8.

Figure 2-8. Model 220 Recommended Operating Limits

### 2.5 APPLICATIONS

### 2.5.1 Calibration

Model 220, with its high accuracy, can be used as current calibration source. The required current values and voltage compliance limits can be programmed into the memory locations. The three different program modes allow the operator to run through the programmed values wether manually (step) or automatically (single or continuous). In the single or continuous program mode different dwell times can be programmed. This allows the operator to tailor the dwell times to his needs. The step program modes may be the best way to run through the calibration steps. In this mode the operator can manually step through the memory locations and therefore, output the current when it is required by the calibration procedure.

### 2.5.2 Resistivity Measurement

Certain semiconductor materials such as silicon have high resistivities. The measurement of their resistivity can be a difficult measurement. To aid in the measurement, special probes of a hard metal such as tungsten are used. Because contact resistance is so high, a four point probe is usually employed. The outer two contact supply a constant current, the inner two contacts measure the voltage drop across a portion of the sample. With the geometry of the probe and wafer known, resistivity can then be calculated.

The current source used must be stable and accurate. The Model 220 is ideal for this application. The accurate and stable current along with compliance voltage can be easily programmed before making the measurement.

The two voltmeters require a high impedance to overcome lead resistance problems. The Model 614 has the high input impedance (greater than $5 \times 10^{13 \Omega}$ in parallel with 20 pF ) re-
quired to make the measurement accurately. Refer to Figure 2-9.

For most wafers the resistivity is calculated from: $P=k t{ }^{Y}$ $k$ is a constant based on the geometry of the wafer and probe. $t$ is the sample thickness.
$V$ is the measured voltage.
$I$ is the current in the sample.

Figure 2-9. Resistivity Measurement Using the Model 220 and Model 614

### 2.5.3 Diode Characterization

With the Model 220 it is possible to plot I-V (current-voltage) characteristics of a diode over several decades. Figure 2-10 shows the configuration to be used. The Model 614, with its high input resistance in the volts function; will allow the measurement to be made accurately. Figure $2-11$ shows several examples of diodes whose curves have been plotted using the configuration of Figure 2-10.

Figure 2-10. Diode Characterization

Figure 2-11. Diode Curves

# SECTION 3 <br> PERFORMANCE VERIFICATION 

### 3.1 INTRODUCTION

Performance verification may be done upon receipt of the instrument to ensure that no damage or misadjustment has occurred during transit. Verification may also be performed whenever there is question of the instrument's accuracy.

## NOTE

For instruments that are still under warranty (less than 12 months since date of shipment), whose performance falls outside specifications at any point, contact your Keithley representative or the factory immediately.

### 3.2 ENVIRONMENTAL CONDITIONS

Measurements should be made at $18^{\circ}-28^{\circ} \mathrm{C}$ and at less than $70 \%$ noncondensing relative humidity, unless otherwise indicated.

### 3.3 RECOMMENDED TEST EQUIPMENT

Table 3-1 lists all the test equipment required for verification. If alternate equipment is used, the alternate test equipment's specifications must be at least as good as the equipment specifications listed in Table 3-1.

### 3.4 INITIAL CONDITIONS

The Model 220 must be turned on and allowed one hour for warm-up. If the instrument has been subjected to extremes of temperature, allow sufficient time for internal temperatures to reach normal operating conditions as specified in paragraph 3.2. Typically, it takes one hour to stabilize a unit that is $10^{\circ} \mathrm{C}\left(18^{\circ} \mathrm{F}\right)$ out of the specified temperature range.

### 3.5 PERFORMANCE VERIFICATION PROCEDURE

Use the following procedure to verify the accuracy of the Model 220. If the Model 220 is out of specification, proceed to Section 5 Maintenance, unless the Model 220 is under warranty.

## WARNING

Verification should be performed by qualified personnel using accurate and reliable test equipment.

NOTE
The allowable reading for each range includes the tolerances of the recommended test equipment. If different test equipment is used, modify the allowable readings accordingly.

### 3.5.1 100 mA to 1 mA Range Verification

1. Connect the Model 220, Modef 192 and the $100 \Omega$ load resistor as shown in Figure 3-1.
2. Select the 20VDC range on the Model 192.
a. Program the Model 220 to output $+00.00-3$. Verify that the reading on the Model 192 does not exceed +5 mV .
b. Program the Model 220 to output $+00.000-3$. Verify that the reading on the Model 192 does not exceed +1 mV .
c. Select 2V range on the Model 192. Program the Model 220 to output $+.0000-3$. Verify that the reading on the Model 192 does not exceed $+100 \mu \mathrm{~V}$. Select the 20 V range on the Model 192.
3. Program the Model 220 for 50 mA with a 20 V compliance limit.
4. Press the OPERATE button on the Model 220.
5. Verify that the reading on the Model 192 display is within the limits specified in Table 3-2.
6. Repeat steps 2 through 5 for the 10 mA and 1 mA range.
7. Repeat steps 2 through 6 with negative output current.

## NOTE

Because of the power constraints on the 1002 resistor $(1 / 4 \mathrm{~W})$, the 100 mA range must be checked with a test current of 50 mA . When checking this range, only apply power momentarily to prevent the resistor from overheating.

Table 3-1. Recommended Test Equipment

| Item | Description | Specification | Mifr. | Model |
| :---: | :--- | :--- | :---: | :---: |
| A | DMM | $0.005 \%$ (2V range) | Keithley | 192 |
| B | Precision Resistor | $100 \Omega \pm 0.01 \%, 1 / 4 \mathrm{~W}$ | Keithley | R-196-100 |
| C | Precision Resistor | $100 \mathrm{k} \Omega \pm 0.01 \%$ | Caddock | TF020N |
| D | Precision Resistor | $10 \mathrm{M} \Omega \pm 0.25 \%$ | Keithley | R-305-10M |
| E | Precision Resistor | $1 \mathrm{G} \Omega \pm 2 \%$ | Keithley | R-289-1G |
| F | Tera-Ohmmeter | $10 \mathrm{M} \Omega$ Range; $\pm 0.025 \%, 1 \mathrm{G} \Omega$ Range; $\pm 0.05 \%$ | Guildline | 9520 |
| I | Test Fixture |  |  |  |

Figure $\mathbf{3 - 1}$. 100 mA to 1 mA Range Verification

Table 3-2. 100mA to 1 mA Verification

| Model 220 <br> Range | Model 220 <br> Output | Model 192 <br> Range | Model 192* <br> Allowable Reading <br> $\left(18^{\circ} \mathrm{C}\right.$ to $\left.\mathbf{2 8}^{\circ} \mathrm{C}\right)$ |
| :---: | :---: | :---: | :---: |
| 100 mA | $50.00 \mathrm{mA**}$ | 20 Vdc | 5.0090 to 4.9910 |
| 10 mA | 10.000 mA | 2 Vdc | 1.00132 to 0.99868 |
| 1 mA | 1.0000 mA | 2 Vdc | 0.10013 to 0.09987 |

*Includes test equipment tolerances.
**Apply momentarily to prevent the resistor from overheating.

### 3.5.2 $100 \mu \mathrm{~A}$ and $10 \mu \mathrm{~A}$ Range Verlfication

1. Replace the $100 \Omega$ resistor in Figure $3-1$ with the $100 \mathrm{k} \Omega$ resistor specified in Table 3-1.
2. Select the 20VDC range on the Model 192.
a. Program the Model 220 to output $+00.00-6$. Verify that the reading on the Model 192 does not exceed +10 mV .
b. Program the Model 220 to output $+0.000-6$. Verify that the reading on the Model 192 does not exceed +1 mV .
3. Program the Model 220 to output $+100.00-6 \mathrm{amps}$ with 20 V compliance.
4. Verify the reading on the Model 192 to be between 10.0120 and 9.9880 .
5. Select the 2VDC range on the Model 192.
6. Program the Model 220 to output $+10.000-6 \mathrm{amps}$ with 20 V compliance.
7. Verify the reading on the Model 192 to be between 1.00122 and 0.99878.
8. Repeat steps 2 through 7 with negative output current.

### 3.5.3 $1 \mu \mathrm{~A}$ and 100nA Range Verlfication

1. Construct the test fixture shown in Figure 3-2 using the $10 \mathrm{M} \Omega$ resistor as R.
2. Measure the $10 \mathrm{M} \Omega$ resistor with the Guildine 9520 and note the value.
3. Set up the circuit shown in Figure 3-3.
4. Set the Model 192 to the 20VDC range.
5. The GUARD of the Model 220 may input an offset of $\pm 1 \mathrm{mV}$ to the Model 192. To cancel this offset, proceed as follows:
A. Program the Model 220 to output $\pm 0.0000-6 \mathrm{~A}$.
B. Short the $10 \mathrm{M} \Omega$ resistor.
C. Zero the display of the Model 192 by pressing the ZERO button.
D. Remove the short from the $10 \mathrm{M} \Omega$ resistor.
6. Program the Model 220 to output $+1.0000-6 \mathrm{~A}$ with a 20 V compliance.
7. Using the measured value of the $10 \mathrm{M} \Omega$ resistor, calculate the voltage drop across that resistor.
Example: $(+1.0000-6 \mathrm{~A}) \times(10.001 \mathrm{M} \Omega)=10.0010 \mathrm{~V}$.
(Model 220 Programmed Output) $\times$ (Measured Resistance) $=$ (Expected Voltage Drop Across R).
8. Verify that the reading on the Model 192 is the calculated voltage drop $\pm 0.0165 \mathrm{~V}$.
9. Place the Model 220 in the standby mode and take the Model 192 out of the zero mode (ZERO annunciator off).
10. Set the Model 192 to the 2VDC range.
11. Cancel the effects of guard offset from the Model 220 as follows:
A. Program the Model 220 to output $+000.0-9 \mathrm{~A}$.
B. Short the $10 \mathrm{M} \Omega$ resistor.
C. Zero the display of the Model 192 by pressing the ZERO button.
D. Remove the short from the $10 \mathrm{M} \Omega$ resistor.
12. Program the Model 220 to output $+100.00-9 \mathrm{~A}$ with a 20 V compliance.
13. Using the measured value of the $10 \mathrm{M} \Omega$ resistor, calculate the voltage drop across that resistor.
Example: $(+100.00-9 \mathrm{~A}) \times(10.001 \mathrm{M} \Omega)=1.00010 \mathrm{~V}$.
(Model 220 Programmed Output) $\times$ (Measured Resistance) $=($ Expected Voltage Drop Across R).
14. Verify that the reading on the Model 192 is the calculated voltage drop $\pm 0.00367 \mathrm{~V}$.
15. Repeat steps 4 through 14 with negative current output
16. Place the Model 220 in the standby mode and take the Model 192 out of the zero mode

Construction Notes:

1. To decrease settling times and to assure accurate calibrations, it is recommended to use an internal guard las shown in the drawing above). The guard must be insulated from the surrounding case.
2. To further minimize inaccuracies, current leakage paths to ground for guard) must be minimized. This requires the use of low leakage insulating materials for construction and the use of special cleansing agents such as freon ${ }^{\odot}$ to clean the components and insulators after construction.

### 3.5.4 10nA and 1nA Range Verification

1. Construct the test fixture shown in Figure $3-2$ using the 1Gת resistor specified in Table 3-1.
2. Measure the $1 G \Omega$ resistor with the Guildine 9520 and note the value.
3. Set up the circuit shown in Figure 3-3.
4. Set the Model 192 to the 20VDC range.
5. Cancel the effects of guard offset from the Model 220 as follows:
A. Program the Model 220 to output $0.000-9 \mathrm{~A}$.
B. Short the 1G』 resistor.
C. Zero the display of the Model 192 by pressing the ZERO button.
D. Remove the short from the $1 \mathrm{G} \Omega$ resistor.
6. Program the Model 220 to output $+10.000-9 \mathrm{~A}$ with a 20 V compliance.
7. Using the measured value of the $1 \mathrm{G} \Omega$ resistor, calculate the voltage drop across that resistor.
Example: $(+10.000-9 \mathrm{~A}) \times(1.001 \mathrm{G} \Omega)=10.0100 \mathrm{~V}$.
(Model 220 Programmed Output) $\times$ (Measured Resistance) $=($ Expected Voltage Drop Across R).
8. Verify that the reading on the Model 192 is the calculated voltage drop $\pm 0.0340 \mathrm{~V}$.
9. Place the Model 220 in the standby mode and take the Model 192 out of the zero mode.
10. Set the Model 192 to the 2VDC range.
11. Cancel the effects of guard offset from the Model 220 as follows:
A. Program the Model 220 to output $+.0000-9 \mathrm{~A}$.
B. Short the $1 \mathrm{G} \Omega$ resistor.
C. Zero the display of the Model 192 by pressing the ZERO button.
D. Remove the short from the $1 \mathrm{G} \Omega$ resistor.
12. Program the Model 220 to output $+1.0000-9 \mathrm{~A}$ with a 20 V compliance.
13. Using the Measured value of the $1 G \Omega$ resistor, calculate the voltage drop across that resistor.
Example: $(+1.0000-9 \mathrm{~A}) \times(1.001 \mathrm{G} \Omega)=.00100 \mathrm{~V}$.
(Model 220 Programmed Output) $\times$ (Measured Resistance) $=($ Expected Voltage Drop Across R).
14. Verify that the reading on the Model 192 is the calculated voltage drop $\pm 0.00542 \mathrm{~V}$.
15. Repeat steps 4 through 14 with negative current output.

Figure 3-3. $1 \mu \mathrm{~A}$-1nA Range Verification

## SECTION 4 THEORY OF OPERATION

### 4.1 INTRODUCTION

This section contains circuit descriptions for the Model 220. The information is arranged to provide a circuit description of individual functional circuit blocks. To facilitate understanding, the descriptions are keyed to accompany simplified block diagrams and schematics. Detailed schematics of the Model 220 are located in Section 6.

### 4.2 BLOCK DIAGRAMS

The circuitry of the Model 220 is represented by the two simplified block diagrams in Figures 4-1 and 4-2. Figure 4-1 shows a simplified block diagram of the Model 220's analog circuitry (power supply, range circuitry, amplifiers etc.). Figure 4-2 shows a simplified block diagram of the Model 220's digital circuitry (microprocessor, RAM, ROM, VIA etc.).

### 4.3 POWER SUPPLY

To facilitate understanding of the following discussion refer to schematic diagram 220-106 (sheet 2 of 2). The power supply is a conventional AC to DC power converter. Transformer T101, has three separate secondaries that are fed into three separate bridge rectifiers CR101, CR108 and the bridge configuration of CR102 through CR105. The output of CR101 is fed into regulator VR101 and is filtered by C107 and C103 producing the +5 V digital supply. The output of CR108 is fed into VR102 and VR103 and is filtered by C119 through C 122 to produce the positive and negative 15 V supplies. The output of CR102 through CR105 is filtered by C 117 and C118 to produce the positive and negative 125 V supplies. R118 and R119 are bleeder resistors to prevent charge retention after AC power is removed.

A tap off of the primary of the transformer T101 supplies the nominal 115VAC to the fan.

### 4.4 ANALOG BOARD

To facilitate understanding of the following discussion refer to schematic diagram 220-126 (sheet 1 and 2).

The heart of the analog board is the high voltage electrometer op amp which is centered on U319. The performance of U319 is bootstrapped up to the voltage leveis supplying Q318 and Q319 by Q315-Q319, Q313-Q318 and their associated circuitry. Q301, Q302, R344, R348, R349, C313 and C320 establish frequency stability for U319. R343 is an input voltage offset adjustment for U319.

A constant current source can be derived by a series voltage source and resistance from the output lanalog common/guard) to the amplifier input. The amplifier input to the common of the high voltage supplies of Q318/Q319 (output common) comprises a current source. Range resistors R358, R361, R362, R378, R375, R376, R380 and R381 along with their associated calibration potentiometers, comprise the series resistance section of the current source. These resistances connect to the input node of the amplifier through relays K301-K305. When several resistances are connected through a common relay, JFET switches Q303 through Q310 are used to distinguish which resistor is being used. Several JFETs are organized in pairs for voltage sensing at the resistor to compensate for the voltage drop in the current carrying JFET.

U315 serves as a sense amplifier with Q311, Q312, R344 and R345 as a high current buffer for the higher current ranges. U314, U318A and U320 B, C, D, E and F drive the range relays. U318B, U317 and U313 A, B, C and D drive the JFET switches. U313 and U317 are voltage comparators with open collector outputs. Combined with R350, this circuitry provides the voltage drive for the switching JFETs.

The voltage source section centers around U311, the 12 bit digital to analog converter (DAC). Associated circuitry R301 through R307 and R316, are used to adjust offset and positive gain. Gain is set on the 1 mA range and therefore R376 does not have an adjustment. Following this circuitry is a network providing a +1 - operator to the output of U311. U312 provides the active portion while switches on U306 along with resistors R317, R318, R320 and R323 provide a selectable gain of +1 or -1 .

R318 provides a gain adjust ( -1 mA ) for this operator. The output is fed to the sense amplifier U315. R392 is an offset voltage adjustment potentiometer for U312 and U315.

Serial to parallel shift/store registers U301, U302 and U303 provide digital control from the serial data link. Data is inputted via the clock and latch lines. Latch selects the data in mode as either recirculated data out (latch=logic 0 ) or the overcompliance ( V -limit) information (latch = logic 1). This selection is performed by U304A and B, U316B and C and U305A.

Gates U305B, C and D form a flip-flop for controlling the tristate mode of the outputs of U301, U302 and U303. This circuitry, along with R351, R352, CR307, C305, etc., prevents erroneous current source outputs both on acquisition and loss of $A C$ line power.

Figure 4-2. Digital Circuitry Block Diagram

The remaining portion of the analog circuitry produces the selectable compliance voltage limit. An 8 bit digital-toanalog converter (DAC) U308 starts this process. With 128 combinations, each step is scaled to represent one volt of compliance. Since U308 is a current output DAC, U309 is required to revert back to a voltage level. The output of U309 then represents the selected compliance voltage scaled down by a factor of 20.

This signal and its inverse (U309A, R324 and R327) are applied to divider network R331 and R336 which are referenced to output common. At the junction of each divider network is an amplifier which reverses the previous scaling factor. Resulting from this is an error voltage approximately equal to the difference between the actual compliance voltage level and the programmed level. Each amplifier U307A and $B$ and the associated circuitry, is coupled through diodes CR303 and CR302 on R333. The polarity of the diodes is arranged such that a voltage is impressed on R333 only when the actual voltage compliance exceeds $+/-$ the programmed value. This result is applied to the output node via low leakage diode CR304 preventing any further compliance voltage excursion. Current from the range resistors is shunted through diodes CR305 and CR306 when this operation fimit occurs. Resistors R330 and R332 add an offset to compensate for diode drops in CR302 through CR304.

The circuit configuration of U313A and B comprise a window comparator to detect a V-limit condition across R333. The comparator limits are set by resistor divider network R338 through R341. U313A and B open collector outputs are configured in a "wire ORed" fashion through pull up resistor R346. Whenever the voltage across R333 exceeds the comparator limits, a logic 1 is developed through current limiting resistor R347 to the output of inverter U316E. C311 is used for stabilization.

VR301 supplies the digital circuitry with the required +5 V . This voltage is also supplied to the digital board for use by the optically isolated portion of the circuitry.

### 4.5 DIGITAL BOARD (Microcomputer)

To facilitate understanding of the following discussion refer to schematic diagram 220-106 (sheet 1 of 2). For an overall block diagram of the digital circuitry refer to Figure 4-2.

The microcomputer and its associated logic circuitry, controls front panel functions (source, dwell time, program control etc.), operation of the front panel display and data through the IEEE-488 interface circuitry.

The microcomputer includes a 6808 microprocessing unit U115; a 6522 versatile interface adapter U114; two 2732 ROMs U109 and U111; four 2114 RAMs U101, U103, U105 and U107; an address decoder U110; a data bus driver U116 and the necessary reset logic. The memory utilized in this system is shown in the memory map (Figure 4-3). Using ad-
dress lines A13, A14 and A15; U110 sections the $64 k$ of memory space into $8 k$ and 4 k segments. The total memory used is a small portion of the entire addressing capabilities of the 6808 microprocessor U115. Memory locations for the 64 k addresses are assigned the values $0000_{16}$ through FFFF ${ }_{16}$.

Interfacing of the microprocessor with the RAMs, ROMs, Front Panel, VIA or the IEEE-488 interface is controlled by the address decoder, U110.

Partial address decoding is used in this system. The function selected is determined by the state of the address lines A13, A14 and A15. These address lines determine which output is selected at the decoder U110 in accordance with the memory map. Only one of the devices (RAM, ROM, VIA, etc.) will have access to the data bus at any time. The address decoder selects one of the devices only after a Valid Memory Address VMA has been asserted at the decoders input EN (pin 6). The VMA signal is generated by the 6808 microprocessor.

Timing for the computing sequence is provided by the 4 MHz crystal Y 101 . The 6808 microprocessor divides this signal by four to produce a 1 MHz signal at the $\Phi 2$ output ( pin 37 ).

U102, U104, U106C, U108C and their associated circuitry, forms a reset network (watchdog) which resets the microprocessor, VIA and the IEEE-488 interface. The circuit actuates in the event the front panel display is not updated after a specific period of time has elapsed due to a lost program or power line transient.

The digital circuitry is optically isolated from the analog circuitry by AT101 through AT104, U113A, B, U117 and their associated circuitry. The output signals consist of latch, clock and data out. These signal lines permit serial communication to the analog circuitry. The data in signal line is received from the analog circuitry and is either the recirculated data or the overcompliance ( V -limit) data depending on the state of the latch line. When the latch line is a logic 1 , the data in line will represent the compliance state (logic 1 implies an overcompliance or $V$-limit). When the latch line is a logic 0 , the data in line will be the recirculated data sent out to the analog side as data out. This data is inverted on the digital side of the isolation.

The remaining circuitry on the digital board consists of external trigger inputs and outputs. C123, CR112, CR111, R121 and R128 comprise an input protection network for triggering input to PB6 of the VIA (U114). V113D, CR109, CR110, R127 and R122 buffer a triggered output originated on PB3 of the VIA (U114).

### 4.6 DISPLAY CIRCUIT

The display information is outputted on PA0 through PA7 on the VIA (I/O) bus. The information is updated at a 1 kHz
rate which means, each digit is on for 1 ms . Each update begins by presenting new segment information on the VIA (I/O) bus (PAO-PA7) and outputting a clock pulse on CA2. The clock pulse inputs to U203 and shifts a digit enable bit to the next digit to be enabled. Every eight times the display is updated, a digit enable bit is generated at PB5 and goes to the enable data input of the shift register.

The first four digit drivers drive the rows of the switch matrix. The switches are arranged in a four by six matrix. The segment drivers are 0201 through Q208. In addition to driving the various segments, they also activate the appropriate LEDs.

Figure 4-3. Memory Map

# SECTION 5 <br> MAINTENANCE 

### 5.1 INTRODUCTION

This section contains information necessary to maintain the Model 220. Calibration adjustment, troubleshooting, fuse replacement, line voltage selection, fan filter cleaning and all information pertinent to maintenance is provided.

### 5.2 CALIBRATION

Calibration should be performed yearly (every 12 months) or whenever performance verification (see Section 3) indicates that the Model 220 is out of specification. If any step in the calibration procedure cannot be performed properly, refer to paragraph 5.4 for troubleshooting information or contact your Keithley representative or the factory.

## WARNING

All service information is intended for qualified electronic maintenance personnel only.

### 5.2.1 Recommended Test Equipment

Recommended test equipment for calibration is listed in Table 5-1. Alternate test equipment may be used. However, the accuracy of the alternate test equipment must at least be equal to the specifications in Table 5-1.

### 5.2.2 Environmental Conditions

Calibration should be performed under laboratory conditions having an ambient temperature of $23^{\circ} \mathrm{C} \pm 1^{\circ} \mathrm{C}$ and a relative humidity of less than $50 \%$.

### 5.2.3 Warm-Up

The Model 220 must be turned on and allowed one hour for warm-up. If the instrument has been subjected to extremes of temperature, allow sufficient time for internal temperatures to reach normal operating conditions. Typically, it takes one hour to stabilize a unit that is $10^{\circ} \mathrm{C}\left(18^{\circ} \mathrm{F}\right)$ out of the specified temperature range.

### 5.2.4 Calibration Fixtures

In order to meet the specifications of the Model 220, the $10 \mathrm{M} \Omega$ and $1 \mathrm{G} \Omega$ resistors used to calibrate the Model 220 must be enclosed in a guarded fixture. The guarded fixture must be constructed. The following items are necessary for proper construction of the calibration fixture:

1. $10 \mathrm{M} \Omega$ Resistor, Keithley Part Number R-305-10M
2. 1G $\Omega$ Resistor, Keithley Part Number R-289-1G
3. Two enclosed chassis boxes, one to be placed inside the other and insulated from each other.
4. One Triax Connector, Keithley Part Number CS-181
5. One Banana Jack, Keithley Part Number BJ-11

The test fixture shown in Figure 5-2 is to be used to calibrate the $1 \mu \mathrm{~A}$ and 100 nA ranges. A duplicate test fixture must be constructed with the $1 G \Omega$ resistor in order to calibrate the $10 n A$ and $1 n A$ ranges.

Figure 5-1. Calibration Setup

Table 5-1 Recommended Test Equipment

| Item | Description | Specification | Mifr. | Model |
| :---: | :---: | :---: | :---: | :---: |
| A | DMM | $\pm 0.005 \%$ to $10 \mu \mathrm{~V}$ | Keithley | 192 |
| B | Resistor* | $10 \Omega \pm .1 \%$ | Keithley | R-185-10 |
| C | Resistor* | $100 \Omega \pm .1 \%$ | Keithley | R-308-100 |
| D | Resistor* | $1 \mathrm{k} \Omega \pm .1 \%$ | Keithley | R-315-1k |
| E | Resistor* | $100 \mathrm{k} \Omega \pm .02 \%$ | Keithley | R-182-100k |
| F | Resistor* | $10 \mathrm{M} \Omega \pm .25 \%$ | Keithley | R-305-10M |
| G | Resistor* | $1 \mathrm{G} \Omega \pm 2 \%$ | Keithley | R-289-1G |
| H | Teraohmeter |  | Guildline | 9520 |
| I | Calibration Fixture |  |  |  |

NOTE*
Before placing the resistors in the test configurations, measure them and note the value. Zero the Model 192 before measuring the $10 \Omega, 100 \Omega, 1 \mathrm{k} \Omega$ and the $100 \mathrm{k} \Omega$ resistors with the Model 192. Measure the $10 \mathrm{M} \Omega$ and $1 \mathrm{G} \Omega$ resistors with the Guildine 9520 . These values will be used later in the calibration procedure.

### 5.2.5 Calibration Adjustments

Use the following procedure and make the adjustments indicated to calibrate the Model 220. To locate adjustment points, remove the top cover and refer to the analog board shield.

## WARNING

To prevent a shock hazard, turn the instrument off, remove the line cord and all test leads from the instrument before removing the top cover.

1. Remove the top cover (see paragraph 5.5 , step 1). Warmup with top cover in place. Minimize the time the cover is removed.
2. Short the output of the Model 220 (HI to LO). Monitor the guard output with the Model 192 (Item A Table 5-1) on the .2VDC range. Program the Model 220 for an output of $+.0000-3 \mathrm{amps}$ and a compliance of 10 V . Locate and adjust R343 for a reading on the Model 192 of $.000000 \pm 20 \mu \mathrm{~V}$.
3. Remove the short from the output and connect the Model 220 and Model 192 as shown in Figure 5-1. Program the Model 220 output $+.0000-3$ amps. Monitor the Model 220 output on the Model 192. Invert the Model 220 output (press $\pm$ and ENTER on the Model 220) and note the change in current. Calculate the average reading when the output is changed from positive to negative and adjust R304 for the calculated value. Then adjust R392 for a reading of less than $\pm 100 \mathrm{nA}(100 \mu \mathrm{~V}$ across $1 \mathrm{k} \Omega)$.
4. Set up the circuit shown in Figure 5-1 and 5-3. Follow Table 5-2 to calibrate the ranges of the Model 220.

## NOTE

The allowable reading on the Model 192 is the product of the measured shunt resistance times the Model 220 output. For example in Table 5-2, step a:
measured shunt resistance $=1 \mathrm{k} \Omega$
Model 220 output $=1.9 \mathrm{~mA}$
calculated output $=1.9 \mathrm{~V} \pm 300 \mathrm{ppm}$ or $570 \mu \mathrm{~V}$
5. Remove the current measurement test configuration and monitor the Model 220 output with the Model 192 on the 200VDC range. Program the Model 220 to +19.000 E- 6 amps and a compliance of 100V. Adjust R319 for a reading of $100.000 \pm 0.2 \mathrm{~V}$.
6. This completes the calibration of the Model 220. To verify correct calibration refer to Section 3.

Construction Notes:

1. To decrease setting times and to assure accurate calibrations, it is recommended to use an internal guard las shown in the drawing abovel. The guard must be insulated from the surrounding case.
2. To further minimize inaccuracies, current leakage paths to ground for guard) must be minimized. This requires the use of low leakage insulating materials for construction and the use of special cleansing agents such as freon ${ }^{*}$ to clean the components and insulators after construction.

Figure 5-2. Calibration Fixture

Figure 5-3. $1 \mu \mathrm{~A}$ to InA Calibration

### 5.3 FUSE REPLACEMENT

If power fails, first verify that the fuse (F101) is not defective before disassembling the Model 220. If the line voltage setting is changed ( $\mathbf{S 1 0 2}$ ) the fuse must be replaced according to Tables 5-3 and 5-4. The fuse is accessible from the rear panel. To replace the fuse proceed as follows:

1. Turn power off and disconnect the line cord.

Table 5-2. Calibration

| Step | 220 Setting (Range) | Compliance | Adjustment Point | Shunt R | $\begin{array}{\|c\|} \hline \text { Model } 192 \\ \text { Range } \\ \hline \end{array}$ | Allowable Reading on the Model 192 at $51 / 2$ Digit Resolution |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| a | 1.9E-3 | 30 V | R303 | 1k8 | 2VDC | $(1 \mathrm{k} \Omega)(1.9 \mathrm{E}-3)=$ Calculated Output $\pm 300 \mathrm{ppm}$ or $570 \mu \mathrm{~V}$ |
| b | -1.9E-3 | 30 V | R318 | 1k』 | 2VDC | $(1 \mathrm{k} \Omega)(-1.9 \mathrm{E}-3)=$ Calculated Output $\pm 300 \mathrm{ppm}$ or $570 \mu \mathrm{~V}$ |
| c | 100E-3 | 30 V | R381 | 108 | 2VDC | (102)(100E-3) = Calculated Output $\pm 750 \mathrm{ppm}$ or $750 \mu \mathrm{~V}$ |
| d | 19E-3 | 30 V | R386 | 1008 | 2VDC | $(1002)(19 E-3)=$ Calculated Output $\pm 300 \mathrm{ppm}$ or $570 \mu \mathrm{~V}$ |
| e | 190E-6 | 30 V | R385 | 100k | 20VDC | $(100 \mathrm{k} \Omega)(190 \mathrm{E}-6)=$ Calculated Output $\pm 250 \mathrm{ppm}$ or 4.8 mV |
| $f$ | 19E-6 | 30 V | R384 | $100 \mathrm{k} \Omega$ | 2VDC | $(100 k \Omega)(19 \mathrm{E}-6)=$ Calculated Output $\pm 300 \mathrm{ppm}$ or $570 \mu \mathrm{~V}$ |
|  |  |  | IShunt Mo <br> IUser of | easureme Guarde | nt Technique <br> Fixtures! |  |
| $g$ | 1.9E-6* | 30 V | R354 | 10M8 | 20VDC | $(10 \mathrm{MS})(1.9 \mathrm{E}-6)=$ Calculated Output $\pm 600 \mathrm{ppm}$ or 11.4 mV |
| h | 190E-9* | 30 V | R355 | 10M8 | 2VDC | $(10 \mathrm{MR})(19 \mathrm{E}-9)=$ Calculated Output $\pm 2500 \mathrm{ppm}$ or 4.75 mV |
| i | 19E-9** | 30 V | R356 | 1GR | 20VDC | $(1 \mathrm{GQ})(19 \mathrm{E}-9)=$ Calculated Output $\pm 2250 \mathrm{ppm}$ or 42.8 mV |
| j | 1.9E-9** | 30 V | R357 | 1G8 | 2VDC | $(1 \mathrm{GR})(1.9 \mathrm{E}-9)=$ Calculated Output $\pm 2250 \mathrm{ppm}$ or 4.28 mV |

"Use the constructed 10M 2 Guarded Fixture in the circuit shown in Figure 5-3.
**Use the constructed 1G』 Guarded Fixture in the circuit shown in Figure 5-3.
2. The fuse carrier is spring loaded. Using a slotted screwdriver, push the fuse carrier in and rotate $1 / 4$-turn counterclockwise. The carrier and fuse will eject from the holder.
3. Remove the fuse from the carrier and replace per Table 5-3 or Table 5-4.

## WARNING

To prevent a shock hazard, always turn the instrument off and disconnect the line cord before replacing the line fuse.
CAUTION

Do not install a fuse with a higher rating than specified in Table 5-3 or 5-4. Instrument damage may resuit.
4. To install the fuse and carrier into the holder, reverse the procedure in step 2.

Table 5-3. Fuse Replacement, 3AG Size

| Line <br> Voltage | Fuse F101 | Keithley <br> Part No. |
| :---: | :--- | :---: |
| $90 \mathrm{~V}-110 V^{*}$ <br> $105 \mathrm{~V}-125 \mathrm{~V}$ | $3 / 4 \mathrm{AA}, 250 \mathrm{~V}, 3 \mathrm{3GG}$, SLO BLO | FU-19 |
| $180 \mathrm{~V}-220 \mathrm{~V}^{*}$ | 3/8A, 250V, 3AG, SLO BLO | FU-19 |
| $210 \mathrm{~V}-250 \mathrm{~V}$ | 3/8A, 250V, 3AG, SLO BLO | FU-18 |

*Requires special factory installed transformer TR-187.
Table 5-4. Fuse Replacement, 5mm Size

| Line <br> Voltage | Fuse F101 | Keithley <br> Part No. |
| :---: | :---: | :---: |
| $90 \mathrm{~V}-110 \mathrm{~V}^{*}$ | $0.8 \mathrm{~A}, 250 \mathrm{~V}$, SLO BLO | FU-52 |
| $105 \mathrm{~V}-125 \mathrm{~V}$ | $0.8 \mathrm{~A}, 250 \mathrm{~V}$, SLO BLO | FU-52 |
| $180 \mathrm{~V}-220 \mathrm{~V}^{*}$ | $0.4 \mathrm{~A}, 250 \mathrm{~V}$, SLO BLO | FU-53 |
| $210 \mathrm{~V}-250 \mathrm{~V}$ | $0.4 \mathrm{~A}, 250 \mathrm{~V}$, SLO BLO | FU-53 |

*Requires special factory installed transformer TR-187.

### 5.4 LINE VOLTAGE SELECTION

Set up the Model 220 to operate on the available AC line voltage as follows:

## WARNING

To prevent a shock hazard, turn the instrument off and disconnect the line cord. Also, remove all test leads from the instrument before removing the top cover.

1. Remove the top cover (see paragraph 5.5 step 1).
2. Refer to Table 5-5 and set switch S102 (located near the transformer, underneath the IEEE-488 interface board) accordingly.
3. Install proper fuse per paragraph 5.3.

## NOTE

The line voltage setting of the instrument is marked on the rear panel. The following procedure can be used either to confirm the factory setting, or to set up the instrument for operating on another voltage range. If the line
voltage range is changed, the box next to the selected line voltage should be appropriately marked as an external reminder of the setting. Use a water soluble marking pen.

Table 5-5. Line Voltage Selection

| Line Voltage | Line Frequency | Switch S102 |
| :---: | :---: | :---: |
| $90 \mathrm{~V}-110 \mathrm{~V}^{*}$ | $50 \mathrm{~Hz}-60 \mathrm{~Hz}$ | 115 V |
| $105 \mathrm{~V}-125 \mathrm{~V}$ | $50 \mathrm{~Hz}-60 \mathrm{~Hz}$ | 115 V |
| $195 \mathrm{~V}-235 \mathrm{~V}^{*}$ | $50 \mathrm{~Hz}-60 \mathrm{~Hz}$ | 230 V |
| $210 \mathrm{~V}-250 \mathrm{~V}$ | $50 \mathrm{~Hz}-60 \mathrm{~Hz}$ | 230 V |

*Requires special factory instalied transformer TR-187.

### 5.5 DISASSEMBLY

If it is necessary to remove or replace a component, use the following procedure to aid in disassembly of the Model 220.

1. Remove the top cover as follows:

## WARNING

Turn the instrument off, remove all test leads from the instrument and disconnect the power cord before removing the top cover.
a. Remove the two retaining screws located at the rear of the instrument.
b. Grasping the top cover at the rear, carefully lift it off the instrument.
c. When installing the top cover, make sure that the three tabs located at the front of the cover engage in the front panel assembly.
2. Remove the IEEE-488 interface board.
a. Unplug ribbon cable ( $\mathrm{J} / \mathrm{P} 1004$ ) at the mother board.
b. Remove the phillips head retaining screw located near J1004 on the interface board.
c. Remove the two retaining bolts that secure the interface board and IEEE-488 connector to the rear panel.
d. Lift the interface board out of the mainframe.
3. Remove the analog board shield.
a. Remove the four slot head screws that secure the shield to the analog board.
b. Lift the shield and the four slot head screws away from the analog board.
4. Remove the input node and relay analog shields.
a. Remove the single phillips head screw located in the middle of the shield.
b. Lift both shields away from the analog board.

## NOTE

The circuitry located beneath the analog board shields is extremely sensitive. Do not touch any of the range resistors or input cable.
5. Remove the analog board.
a. Remove the phillips head screw located directly behind the two power transistors with heat sinks.
b. Unplug the ribbon cable ( $\mathrm{J} / \mathrm{P} 1003$ ) from the analog board.
c. Remove the bottom shield of the analog board by removing the two phillips head screws that secure the shield to the board.

## NOTE

Do not remove the input cable.
6. Place the analog board along the side of the Model 220.
7. Remove the mother board from the case.
a. Remove the four plastic standoffs.
b. Remove the two phillips head screws that secure the mother board to the case. They are located at the rear of the mother board one by the fan and the other is by the line voltage selector switch S102.
c. Remove the two phillips head screws that secure the case to the rear panel.
d. Unplug the display ribbon cable (J/P1002) from the mother board.
e. Grasp the mother board and the rear panel simultaneously. Lift the mother board and rear panel up and toward the rear of the instrument. Then lift the mother board and rear panel out of the case.
8. Remove the display board.
a. Remove the two phillips head screws that secure the display board to the front panel.
b. Remove the front panel buttons.
c. Lift the display board out of the case.
9. For reassembly, perform steps 1-8 in reverse order.

## NOTE

When installing connectors J/P1004, J/P1003 and J/P1002 be sure to align pin one of the connector to pin one of the cable.

### 5.6 FAN FILTER MAINTENANCE

The internal temperature generated by the Model 220 necessitates the forced air cooling provided by the fan. The fan has an air filter which keeps the Model 220 relatively free of dust and dirt. Dust and dirt collect on the filter and impede the air flow through the instrument. Lack of air flow will cause overheating. Therefore, the filter must be kept clean in order for the Model 220 to achieve optimum performance. To clean the filter:

1. Remove the filter from the fan.
2. Use compressed air to remove the dust and dirt from the filter. If the filter is excessively dirty wash it in mild soap and water and dry it with compressed air.
3. Reinstall the filter.

### 5.7 SPECIAL HANDLING OF STATIC SENSITIVE DEVICES

MOS devices are designed to function at high impedance levels. Normal static charge can destroy these devices. Table 5-6 lists all the static sensitive devices of the Model 220. Steps 1 through 7 provide instruction on how to avoid damaging these devices.

Table 5-6. Model 220 Static Sensitive Devices

| Reference Designation | Keithley Part No. |
| :--- | :---: |
| U101, U103, U105, U107 | LSI-15 |
| U102 | IC-197 |
| U109 | 220-800-B5 |
| U111 | 220-801-B5 |
| U112, U301, U302, U303 | IC-251 |
| U114 | LSI-28 |
| U115 | LSI-27 |
| U116 | IC-250 |
| U304 | IC-138 |
| U305, U314 | IC-102 |
| U306 | IC-320 |
| U308 | IC-321 |
| U311 | IC-323 |
| U316 | IC-106 |

1. Devices should be handled and transported in protective containers, antistatic tubes or conductive foam.
2. Use a properly grounded work bench and a grounding wriststrap.
3. Handle devices by the body only.
4. PC boards must be grounded to bench while inserting devices.
5. Use antistatic solder suckers.
6. Use grounded tip soldering irons.
7. After devices are soldered or inserted into sockets they are protected and normal handling can resume.

### 5.8 TROUBLESHOOTING

The troubleshooting information in this section is intended for use by qualified personnel who have a basic understanding of the analog and digital circuitry used in a precision test instrument. Instructions have been written to assist in isolating the defective circuit. Isolating the defective component has been left up to the troubleshooter. Refer to Table 5-7 for power supply checks. Refer to Table 5-8 for Analog board checks. Refer to Table 5-9 for digital circuitry checks. Refer to Table 5-10 for display board checks. Refer to Table 5-11. for IEEE-488 interface board checks.

## NOTE

For instruments that are still under warranty (less than 12 months since date of shipment), whose performance falls outside specification at any point, contact your Keithley representative or the factory before attempting troubleshooting or repair.

### 5.8.1 Servicing High Impedance Circuitry

High impedance circuitry is extremely sensitive and must be kept clean of oil, dirt, dust and contaminants. Replacing a component or components within a high impedance circuit requires special cleaning and handling to maintain the high impedance level of the circuit. After replacing any compo-
nent in the high impedance circuitry, or if the high impedance circuitry (1nA-1 $\mu \mathrm{A}$ range resistors) are contaminated, use the following procedure to clean the circuit:

1. Clean the entire high impedance circuit with methanol and a clean cotton swab.
2. Blow dry the circuit with dry nitrogen gas.
3. Inspect the circuit for any residue (contamination) and repeat steps 1 and 2 if any residue is found.
4. Reassemble taking care not to touch the clean components.

### 5.8.2 Digital Self Test

Upon power-up the Model 220 performs a digital self test of the RAM (2114's) chips and a cyclic redundancy check (CRC) of the ROM (2732's) chips. If the self test or the CRC reveals a problem with any of the memory chips, the Model

220 will display an error message corresponding to the defective chip. For example; the digital self test reveals that RAM chip number four is defective. The Model 220 displays a flashing:

## 144444

This informs the operator the RAM chip number four is defective. Refer to Figure 5-4 for chip number assignment.

Figure 5-4. Memory Chip Number Assignment

| 8 | U405 pins 17 and 4 (D3 and B3) | Logic " 0 " ( $\approx 0 \mathrm{~V}$ ) | Information across bus transceiver. |
| 9 | U405 pins 16 and 5 (D4 and B4) | Logic " 0 " ( $\approx 0 \mathrm{~V}$ ) | Information across bus transceiver. |
| 10 | U405 pins 15 and 6 (D5 and B5) | Logic "1" $(\approx+5 \mathrm{~V})$ | Information across bus transceiver. |
| 11 | U405 pins 14 and 7 (D6 and B6) | Logic "0' $(\approx 0 \mathrm{~V})$ | Information across bus transceiver. |
| 12 | U405 pins 13 and 8 (D7 and B7) | Logic "1" $(\approx+5 \mathrm{~V})$ | Information across bus transceiver. |
| 13 | U405 pins 12 and 9 (D8 and B8) | Logic "1" $(\approx+5 \mathrm{~V})$ | Information across bus transceiver. |

NOTE
All measurements in Table 5-11 are referenced to digital common.

## SECTION 6 REPLACEABLE PARTS

### 6.1 INTRODUCTION

This section contains replacement parts information, schematic diagrams, and component location drawings for the Model 220. An exploded view of the Model 220 is shown in Figure 6-1, while an illustration of the Fan Assembly is shown in Figure 6-2.

### 6.2 PARTS LIST

Parts are listed aiphabetically in order of their circuit designations. Table 6-1 contains an index of the schematic diagrams and component location drawings included at the end of this section. Table 6-2 contains a parts list for the Model 220 motherboard. Table 6-3 contains a parts list for the display board. Table 6-4 contains a parts list for the analog board. Table 6-5 contains a parts list for the IEEE interface board.

Table 6-1. Index of Model 220 Schematics and Component Layouts

| Titie | Figure |
| :--- | ---: |
| Display Board Component Layout | $6-3$ |
| Mother Board Component Layout | $6-4$ |
| Analog Board Component Layout | $6-5$ |
| IEEE Interface Board Component Layout | $6-6$ |
| Display Board Schematic | $6-7$ |
| Mother Board Schematic | $6-8$ |
| Analog Board Schematic | $6-9$ |
| IEEE Interface Schematic | $6-10$ |

### 6.3 ORDERING INFORMATION

To place an order, or to obtain information concerning replacement parts, contact your Keithiey representative or the factory. See the inside front cover for addresses. When ordering include the following information:

1. Instrument Model Number
2. Instrument Serial Number
3. Part Description
4. Circuit Description (if applicable)
5. Keithley Part Number

### 6.4 FACTORY SERVICE

If the instrument is to be returned to the factory for service, complete the service form which follows this section and return it with the instrument.

### 6.5 SCHEMATIC DIAGRAMS AND COMPONENT LOCATION DRAWINGS

Schematic diagrams and component location drawings follow the replaceable parts list information in the order listed in Table 6-1.

Figure 6-1. Model 220 Exploded View

NOTE: Mechanical parts that are replaceable show the appropriate part number. The parts that are labeled but do not have a part number are shown for reference purposes only.

Figure 6-2. Model 220 Fan Assembly
