## CIRCUIT DESCRIPTION

### Circuit Configuration By Frequency

The TM-241A/E incorporates a PLL synthesizer which uses a digital VFO to allow any channel step of 5, 10, 12.5, 15, 20, or 25kHz to be selected (See Figure 1).

The receiving system utilizes double-conversion techniques. That is, an incoming signal is mixed down to the 1st intermediate frequency (IF) of 10.7MHz (K,P,X,M,M2,M3,E,E2,E9,EM), 30.825MHz (K2,P2), using a 1st local oscillator frequency of from 133.300 to 135.295MHz (E,E9,EM), 133.300 to 137.295MHz (M), 125.300 to 163.295MHz (K,P,X,M2,M3,E2), 105.175 to 166.820MHz (K2,P2). The 1st IF signal is then mixed with the 2nd local oscillator frequency of

10.245MHz (K,P,X,M,M2,M3,E,E2,E9,EM), 30.37MHz (K2,P2) to generate the 2nd IF of 455kHz.

The transmitting system consists of a PLL circuit which allows direct modulation and direct frequency division. Signals from the PLL circuit are amplified by a linear amplifier for transmission.

### Receiving System

#### • Overview

Incoming signals from the antenna pass through a low-pass filter in the final block of the transmitter system, and are switched to the front-end of the receiver system via a receive/transmit switching diode.

The signals are then passed through an antenna matching coil, where the high-frequency components are amplified by a GaAs FET. The signals are then fed into a three-stage band-pass filter that uses vari-cap tuning to reject unwanted signal components, and is fed to the 1st mixer. The 1st mixer uses the N-channel MOS FET that are used in the RF stage to obtain better two-signal characteristics. The 1st mixer mixes the signal with the 1st local oscillator frequency and converts it to the 1st IF (10.7MHz : K,P,X,M,M2,M3, E,E2,E9,EM, 30.825MHz : K2,P2). The signal then passes through two monolithic crystal filters (MCFs) to remove unnecessary near-by frequency components.

The signal from the MCFs is used as the 1st IF signal.

The 1st IF signal is amplified and fed into IC1 (KCD04) in the FM IF HIC. The IF signal is then mixed with the 2nd local oscillator frequency of 10.245MHz (K,P,X,M,M2,M3,E,E2,E9,EM), 30.37MHz (K2,P2) to generate the 2nd IF of 455kHz. The 455kHz signal is then passed through a six element ceramic filter (CFWM455F), and fed back into IC1 for additional amplification. The output signal from the IC1 is then fed into a power amplifier via the audio volume control for application to the speaker.

#### • S-meter circuit

S-meter control voltage from IC1 (KCD04) in the FM IF HIC is fed into the control unit. The CPU converts the voltage from an analog to digital signal in order to operate the LCD bar meter.

## CIRCUIT DESCRIPTION

### Transmitting System

- Overview

The transmitter produces the target frequency thru the use of direct FM-modulation via a varactor diode.

- Modulation circuit

Audio signals from the microphone are fed into the mic amplifier unit for amplification by the 1st transistor amplifier, and then into two operational amplifiers. The operational amplifiers form a splatter filter for pre-emphasis, amplification, limiting, and removal of unnecessary high-frequency components.

The FM modulation circuit directly FM-modulates the VCO signals, using a varactor diode.

- Pre-amplifier stage circuit

Signals from the VCO are applied to the drive HIC IC8 (KCB05). The amplifier always operates in a linear mode so that signals can be amplified without degradation. Additionally, the amplifier is designed to cover a wide range of frequencies and can produce stable output without adjustment. The APC (Automatic Power Control) controls collector voltage from the last stage of the pre-amplifier.

- Power amplifier circuit

The drive signal is amplified to the required level by the power module. The TM-241A/E uses a large heat sink for efficient heat dissipation.

- APC circuit

The APC circuit for automatic transmit output control detects part of the power module output, and amplifies it to provide a control voltage for output control. The output control voltage is in inverse proportion to the output from the power module, so it is maintained at the same level.

## CIRCUIT DESCRIPTION

### PLL Synthesizer Unit (K,P,X,M,M2,M3,E,E2,E9,EM)

Figure 4-1 is the PLL and VCO block diagram. In the TM-241A/E, the PLL system is implemented as a sub-unit which is divided into the upper VCO and lower PLL blocks. The sub-unit is shielded to prevent external interference.

There are two reference frequencies, 6.25kHz and 5kHz, available to allow 5, 10, 12.5, 15, or 25kHz-step operation. The 6.25kHz is obtained by dividing the reference oscillator frequency of 12.8MHz by 2048, and the 5kHz is obtained by dividing it by 2560. The VCO directly generates the dial frequency. This dial frequency is amplified once and then fed into a pulse swallow-type PLL IC for frequency division and phase comparison, in order to lock the frequency.

The PLL system is locked without switching between transmit mode and receive mode. By using a signal ("H" in transmit mode) from pin 11 of the PLL IC (M54959FP), the LPF is deactivated-activated by Q52 and Q53 only for the moment when the TM-241A/E enters transmit mode. This helps produce lock more rapidly than previous methods.

In 144MHz mode, fvco (RX) is calculated by the following formula;

$$fvco = (144 - 10.7) = \{(n \times 128) + A\} \times fosc + R$$

where,

$fvco$  : VCO output frequency

n : Binary value of the 10-bit programmable counter

A : Binary value of the 7-bit programmable counter

fosc : 12.8MHz reference frequency

R : Binary value of the 14-bit programmable counter

2560 (5, 10, 15, 20, or 25kHz step mode)

2048 (12.5kHz step mode)

In 5, 10, 15, 20, or 25kHz step mode,

n = 208 and A = 36.

Therefore, fvco is calculated as follows;

$$fvco = \{(208 \times 128) + 36\} \times 12800 \div 2560$$

$$= (26624 + 36) \times 5$$

$$= 133300 = 133.300\text{MHz}$$

## CIRCUIT DESCRIPTION

### PLL Synthesizer Unit (K2,P2)

Figure 4-2 is the PLL and VCO block diagram. In the TM-241A/E, the PLL system is implemented as a sub-unit which is divided into the upper VCO and lower PLL blocks. The sub-unit is shielded to prevent external interference.

There are two reference frequencies, 6.25kHz and 5kHz, available to allow 5, 10, 12.5, 15, or 25kHz-step operation. The 6.25kHz is obtained by dividing the reference oscillator frequency of 12.8MHz by 2048, and the 5kHz is obtained by dividing it by 2560. The VCO directly generates the dial frequency. This dial frequency is amplified once and then fed into a pulse swallow-type PLL IC for frequency division and phase comparison, in order to lock the frequency.

The PLL system has two VCOs, one for transmission and one for reception. Using a signal ("H" in transmit mode) from pin 10 of the PLL IC (M54959FP), the LPF is deactivated by Q105 only for the instant when the TM-241A/E enters transmit mode. This helps produce a more rapid PLL lock-up.

In 144MHz mode, fvco (RX) is calculated by the following formula;

$$fvco = (144 - 30.825) = \{(n \times 128) + A\} \times fosc \div R$$

where,

$fvco$  : VCO output frequency

n : Binary value of the 10-bit programmable counter

A : Binary value of the 7-bit programmable counter

fosc : 12.8MHz reference frequency

R : Binary value of the 14-bit programmable counter

2560 (5, 10, 15, 20, or 25kHz step mode)

2048 (12.5kHz step mode)

In 5, 10, 15, 20, or 25kHz step mode,

$n = 176$  and  $A = 107$ .

Therefore, fvco is calculated as follows;

$$fvco = \{(176 \times 128) + 107\} \times 12800 \div 2560$$

$$= (22528 + 107) \times 5$$

$$= 113175 = 113.175\text{MHz}$$

# CIRCUIT DESCRIPTION

- 8T (8V in transmit mode) and unlock circuits

In receive mode, the base of Q17 has 0.7V. As a result, Q17 is on, and Q16 and Q14 are off, and the collector of Q14 (8T) provides no voltage.

The CPU outputs serial data to the shift register IC5 when the PTT switch is depressed. As a result, pin 8 of IC5 becomes "L", turning Q17 off, and Q16 and Q14 on. The 8T line is therefore supplied with 8V.

The unlock circuit operates only in transmit mode. Q18 is a PLL unlocking switching transistor. Usually, the base of Q18 is supplied with 0V ("L"), and the collector is supplied with 8V ("H").

When the PLL is unlocked, the base of Q18 is supplied with 0.7V, turning Q18 on. As a result, the collector of Q18 becomes "L" (0V). This turns Q16 off and the collector of Q14 becomes 8V, turning it off. Therefore, when the PLL is unlocked, Q14 is off removing bias voltage from the 8T line. Without the 8T voltage no transmit signal is generated.

## Digital Control Unit

- **Overview**

The digital control unit consists of a several keys, a rotary encoder input, a display, a reset circuit, a back-up circuit, and a tone output circuit. These circuits are controlled by a single microcomputer (CPU).

- Key and rotary encoder input circuits

The keys on the panel are arranged in matrix. Key input is fed into the CPU, using a key scan technique. Output from the rotary encoder is fed directly into the CPU.

- **Microphone key input circuit**

The UP, DOWN, and other function keys of the microphone are directly connected to their corresponding analog input pins of the CPU. Each of the functions is activated by a voltage generated when the corresponding key is pressed.

**Fig. 6 Microphone key input circuit**

- **Reset and back-up circuits**

When the TM-241A/E power is turned on, the reset circuit sends a "L" level pulse to the RESET pin of the CPU for approx. 3ms. This initiates the power-on reset sequence.

When the TM-241A/E power is turned off, the back-up circuit detects a voltage drop in the 5C line and sets CPU INT4 to a "H" level. This causes the CPU to enter a back-up state.

**Fig. 7** Reset and back-up circuits

## CIRCUIT DESCRIPTION

**• Display circuit**

The display circuit is contained in the LCD assembly. It consists of a LCD driver, its peripheral circuits, and an LCD. The LCD is dynamically operated at a 50% duty cycle. The LCD driver receives LCD data from P33, P140, and P141 of the CPU.

**• Dimmer circuit**

The lamp circuit generates a constant voltage of about 8.8V with SB, Q205, and D202. The lamp circuit resistance is changed by turning Q203 and Q204 on and off to control the dimmer. If the lamp is shorted, Q206 decreases the Q205 VBE to prevent an overcurrent from flowing through Q205.

## LEVEL DIAGRAM

### Receiver section

SG input level for which a 20dB NO (upper) and 12dB SINAD (lower) are obtained. Measured by connecting the SG to each point via a 0.01µF capacitor.

AF level obtained when the AF output level is adjusted for 0.63W 8Ω with the front panel AF VOL control. Measured with AF voltmeter connected to the external speaker jack, receiving a 40dB EMF SSG signal modulated at 1kHz, DEV 3kHz.

### Transmitter section

- AG is set so that MIC input becomes 3kHz DEV at 1kHz MOD.
- Transmitting Frequency : 145.06MHz.

## DRU-1 (DIGITAL RECORDING UNIT)

### DRU-1 CIRCUIT DESCRIPTION

#### 1. Overview

The DRU-1 is a digital recording and playback unit designed to be installed inside the TM-241 A/E series. This unit has the following features:

- Recording received audio (for output to the internal speaker) or transmit audio (microphone input)
- Outputting recorded audio to the internal speaker or outputting recorded audio as modulating signals during transmission
- Built-in lithium battery back-up for maintaining DRU-1 contents
- DTSS and paging code reception.

#### 2. Operations

##### • Recording received audio (for output to the internal speaker)

A received signal from the VO pin is fed into pin 1 (0Y) of the multiplexer IC1 (TC4052BF). It is then fed into pin 59 (MIC IN) of IC3 (TC8830AF) via pin 3 (Y). The signal is amplified approx. 26dB by a mic amplifier in IC3, and output via pin 60 (C1). The signal from pin 60 is fed into pin 63 (C2) and amplified approx. 20dB. The amplified signal is applied to pin 64 (MIC OUT) and pin 65 (ADI).

##### • Recording transmit audio (microphone input)

Microphone input from the VI pin is amplified by Q5, and fed into pin 2 (2Y) of the multiplexer IC1 (TC4052BF). It is then supplied to IC3 (TC8830AF) via pin 3 (Y) and recorded in the same way as in recording received sound.

### DRU-1 DESCRIPTION OF COMPONENTS

#### ACCESSORY UNIT (X42-3010-00)

Component	Use/Function	Description
IC1	Multiplexer	See DRU-1 circuit description.
IC2	DTMF decode	
IC3	Audio recording and playback	See DRU-1 semiconductor data.
IC4~7	S-RAM	
Q1	AF amplification	Receive DTMF input amplification.
Q2	AF amplification	DTMF (from MIC) input amplification.
Q3	AF amplification	BEEP.
Q4	Switch	BEEP AMP.
Q5	AF amplification	Mic input amplification.
Q6	AF amplification	Playback sound amplification.
Q7	Switch	ACL line.
D1	Reverse current prevention	
D2	Reverse current prevention	Back-up.

##### • Outputting recorded audio to the internal speaker

D/A convertor output from pin 66 (DAO) of IC3 (TC8830AF) is passed through a CR filter, and amplified by Q6. The amplified signal is then fed into pin 13 (X) of the multiplexer IC1 (TC4052BF), and output to the VO pin via pin 14 (1X).

##### • Outputting recorded audio as modulating signals during transmission

When sound recorded in the DRU-1 is played during transmission, the same operations as written above in outputting recorded audio to the internal speaker occur. That is, D/A convertor output from pin 66 (DAO) of IC3 (TC8830AF) is passed through a CR filter, amplified by Q6, and fed into pin 13 (X) of the multiplexer IC1 (TC4052BF). The sound, however, is output via pin 11 (3X).

	VOA (pin 10)	VOB (pin 9)	On channel
Output to speaker	H	L	1X (pin 14)
Output during transmission	H	H	3X (pin 11)
Received audio recording	L	L	0Y (pin 1)
Transmit aidop recording	L	H	2Y (pin 2)

Table 1 IC1 : TC4052BF operations

##### • DTSS and paging code reception

The DTMF signal input from the VO pin is amplified by Q1 and input to pin 12 of DTMF decoder IC2 (LR4102N). When the DTMF signal is input to IC2, pin 20 (DV pin) is made high. A DTMF code is then output to pins 1 (D1), 24 (D2), 23 (D4), and 22 (D8) of IC2. The CPU can receive the DTMF signal by detecting the DTMF signal input from the DV pin and reading D1, D2, D4, and D8 data.

### TSU-6 FINE ADJUSTMENT OF TONE FREQUENCY

The tone frequency can be fine adjusted with an interval of 0.5% step over the range of 0 to +1.5%. Ground the T1 (pin 10) and T2 (pin 9) of IC1 to obtain the desired frequency.

	T1	T2
0%	X	X
+0.5%	O	X
+1.0%	X	O
+1.5%	O	O

O : GND, X : OPEN
