## SELECTIVE LEVEL METER

### ML422 B/C

### CERTIFICATION

ANRITSU CORPORATION certifies that this instrument has been thoroughly tested and inspected, and found to meet published specifications prior to shipping.

Anritsu further certifies that its calibration measurements are based on the Japanese Electrotechnical Laboratory and Radio Research Laboratory standards.

### WARRANTY

All parts of this product are warranted by Anritsu Corporation of Japan against defects in material or workmanship for a period of one year from the date of delivery. In the event of a defect occurring during the warranty period, Anritsu Corporation will repair or replace this product within a reasonable period of time after notification, free-of-charge, provided that: it is returned to Anritsu; has not been misused; has not been damaged by an act of God; and that the user has followed the instructions in the operation manual.

Any unauthorized modification, repair, or attempt to repair, will render this warranty void.

This warranty is effective only for the original purchaser of this product and is not transferable if it is resold.

ALL OTHER EXPRESSED WARRANTIES ARE DISCLAIMED AND ALL IMPLIED WARRANTIES FOR THIS PRODUCT, INCLUDING THE WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO A PERIOD OF ONE YEAR FROM THE DATE OF DELIVERY. IN NO EVENT SHALL ANRITSU CORPORATION BE LIABLE TO THE CUSTOMER FOR ANY DAMAGES, INCLUDING LOST PROFITS, OR OTHER INCIDENTAL OR CONSEQUENTIAL DAMAGES, ARISING OUT OF THE USE OR INABILITY TO USE THIS PRODUCT.

All requests for repair or replacement under this warranty must be made as soon as possible after the defect has been noticed and must be directed to Anritsu Corporation or its representative in your area.

**SECTION 1**

**INTRODUCTION**

## SECTION 1 INTRODUCTION

This is the Maintenance Manual for the ML422B/C Selective Level Meter. It covers the following information:

### SECTION 2, MECHANICAL CONFIGURATION AND BLOCK DIAGRAM:

Describes how the various printed circuit boards (PC boards) are laid out, their electrical operation, and how to change the AC line voltage.

### SECTION 3, CALIBRATION AND ADJUSTMENT:

Describes how to perform calibration and adjustment for the local oscillator source and level calibration source.

### SECTION 4, TROUBLESHOOTING AND CIRCUITY:

Describes how to troubleshoot and repair the equipment. Schematic diagrams for the equipment are given in this section.

### SECTION 5, REPLACEABLE PARTS:

Lists the components found in the schematic diagrams and explains how to order replacement parts.

### 1.1 Preventive Maintenance

The preventive maintenance usually means cleaning and visual inspection on a regular basis. They will help to improve the reliability of instrument. The method of the preventive maintenance is shown in Table 1-1.

Table 1-1 Preventive Maintenance

Check	Period	Procedure
Outer cover Soiled	Before storing for long period of time.	Wipe away with industrial cleaning solvent.
Dust	When used in dirty locations. When soiling is conspicuous.	Open covers and blow off with compressed air.
Loosen Knobs	When found them.	Tighten any loosen screws with a suitable tool.

**SECTION 2**  
**MECHANICAL CONFIGURATION**  
**AND BLOCK DIAGRAM**

SECTION 2  
MECHANICAL CONFIGURATION AND BLOCK DIAGRAM

2.1 Mechanical Configuration

Figures 2-1 to 2-13 show blow-up diagrams of the ML422 cabinet.

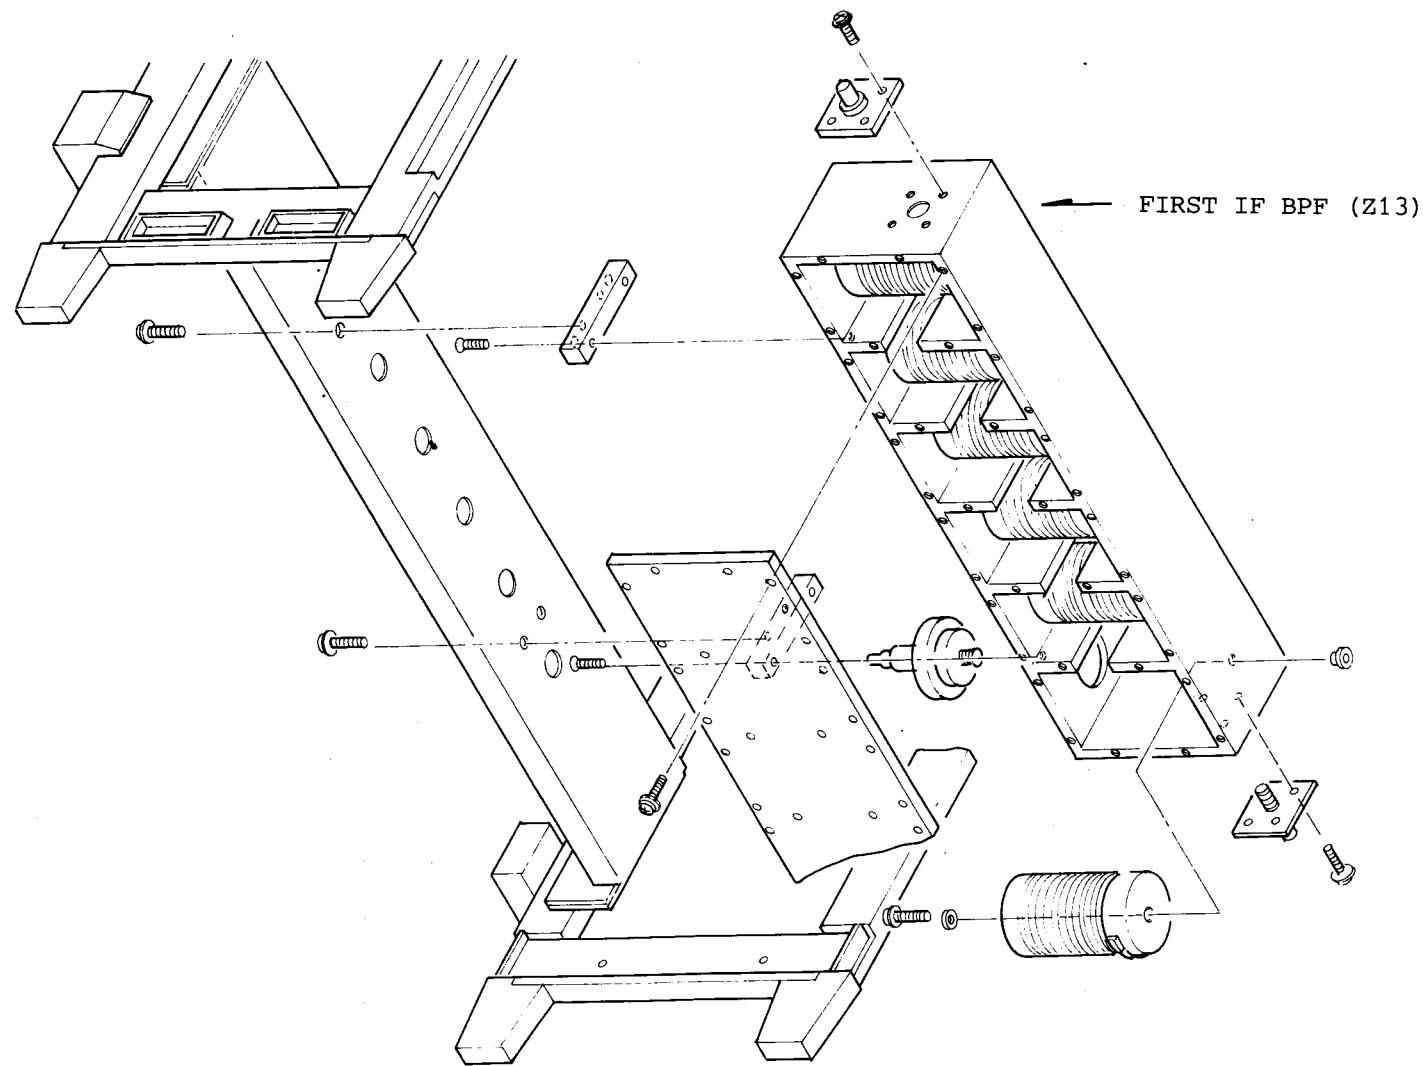

Fig. 2-13      First IF BPF (Rear view)

(1) Removing the top cover

Remove the two screws and take off the top cover. The shield cover shown in Fig. 2-14 can now be seen.

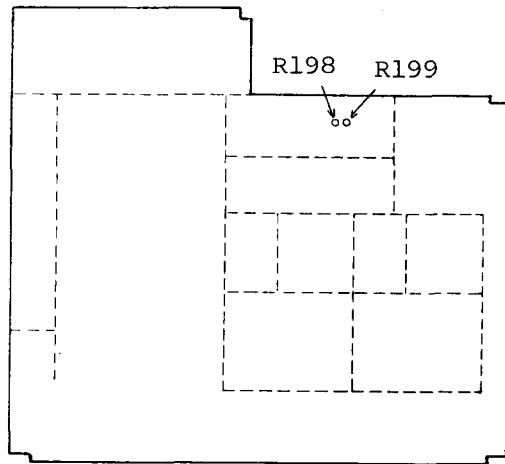

Fig. 2-14 LOCAL Printed Circuit Board (Z4) Shield Cover

This is the shield cover for LOCAL ptinted circuit board Z4. For a detailed description of the LOCAL printed circuit board, see Paragraph 4.4.6.

(2) Removing the front panel

Remove the six screws and pull out the front panel. The ront panel printed circuit board Z6 can now be seen.

(3) Remove the right side panel

Remove the six screws and take off the right side cover. The layers of printed circuit boards can now be seen. The uppermost is CPU printed circuit board Z10. The center one is IF1 printed circuit board Z8.

The lower one is IF2 printed circuit board.

(4) Removing the bottom cover

Remove the two screws, and take off the bottom cover.  
The shield cover shown in Fig. 2-15 can now be seen.

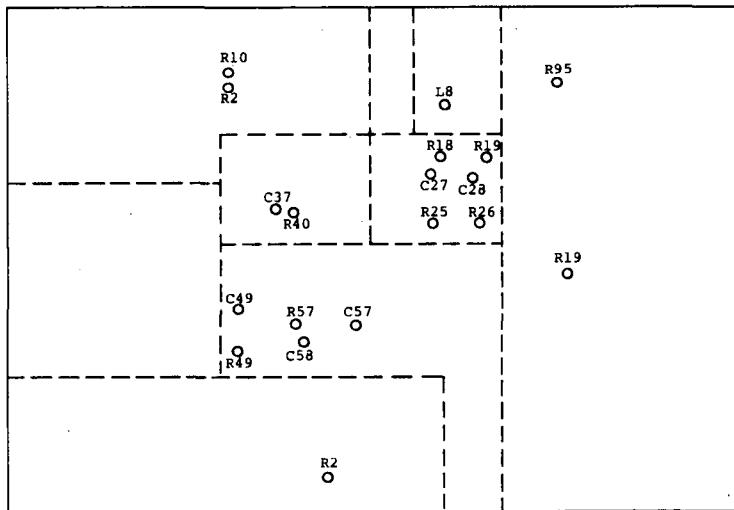

Fig. 2-15 RF/CAL Printed Circuit Board shield cover

This is the shield cover for RF1, RF2 and CAL Printed circuit boards Z1, Z3 and Z2, respectively.

For a detailed description of Printed Circuit boards Z1, Z3 and Z2, see Paragraph 4.4.2.

(5) Removing the rear panel

Remove the six screws and take off the rear panel. The POWER SUPPLY printed circuit board Z11 including the power transformer and REFERENCE OSC Z5 can now be seen.

(6) Removing the left side cover

Remove the six screws and take off the left side panel.  
The MOTHERBOARD Z7 can now be seen.

## 6.2 Block Diagram

The Selective Level Meter ML422B/C consists of six major Sections:

- 1) RF Section
- 2) IF Section
- 3) LOCAL Section
- 4) FRONT PANEL Section
- 5) CPU Section
- 6) POWER SUPPLY Section

A simplified block diagram of the ML422B/C is shown in Fig. 2-16.

### 2.2.1 RF section

An input signal is applied to the 65 dB variable attenuator with high impedance through an input impedance selector.

At the AUTO mode, the signal is automatically controlled at the proper level by this attenuator. The input signal is converted to 56.6 MHz at the first mixer by adding the first local frequency between 56.6 and 86.6 MHz.

In the RF section, the automatic calibration circuit functions in order to measure the input signal accurately.

The calibration signal level is produced by the AGC amplifier, which uses  $75\Omega$ , 0 dBm as the reference.

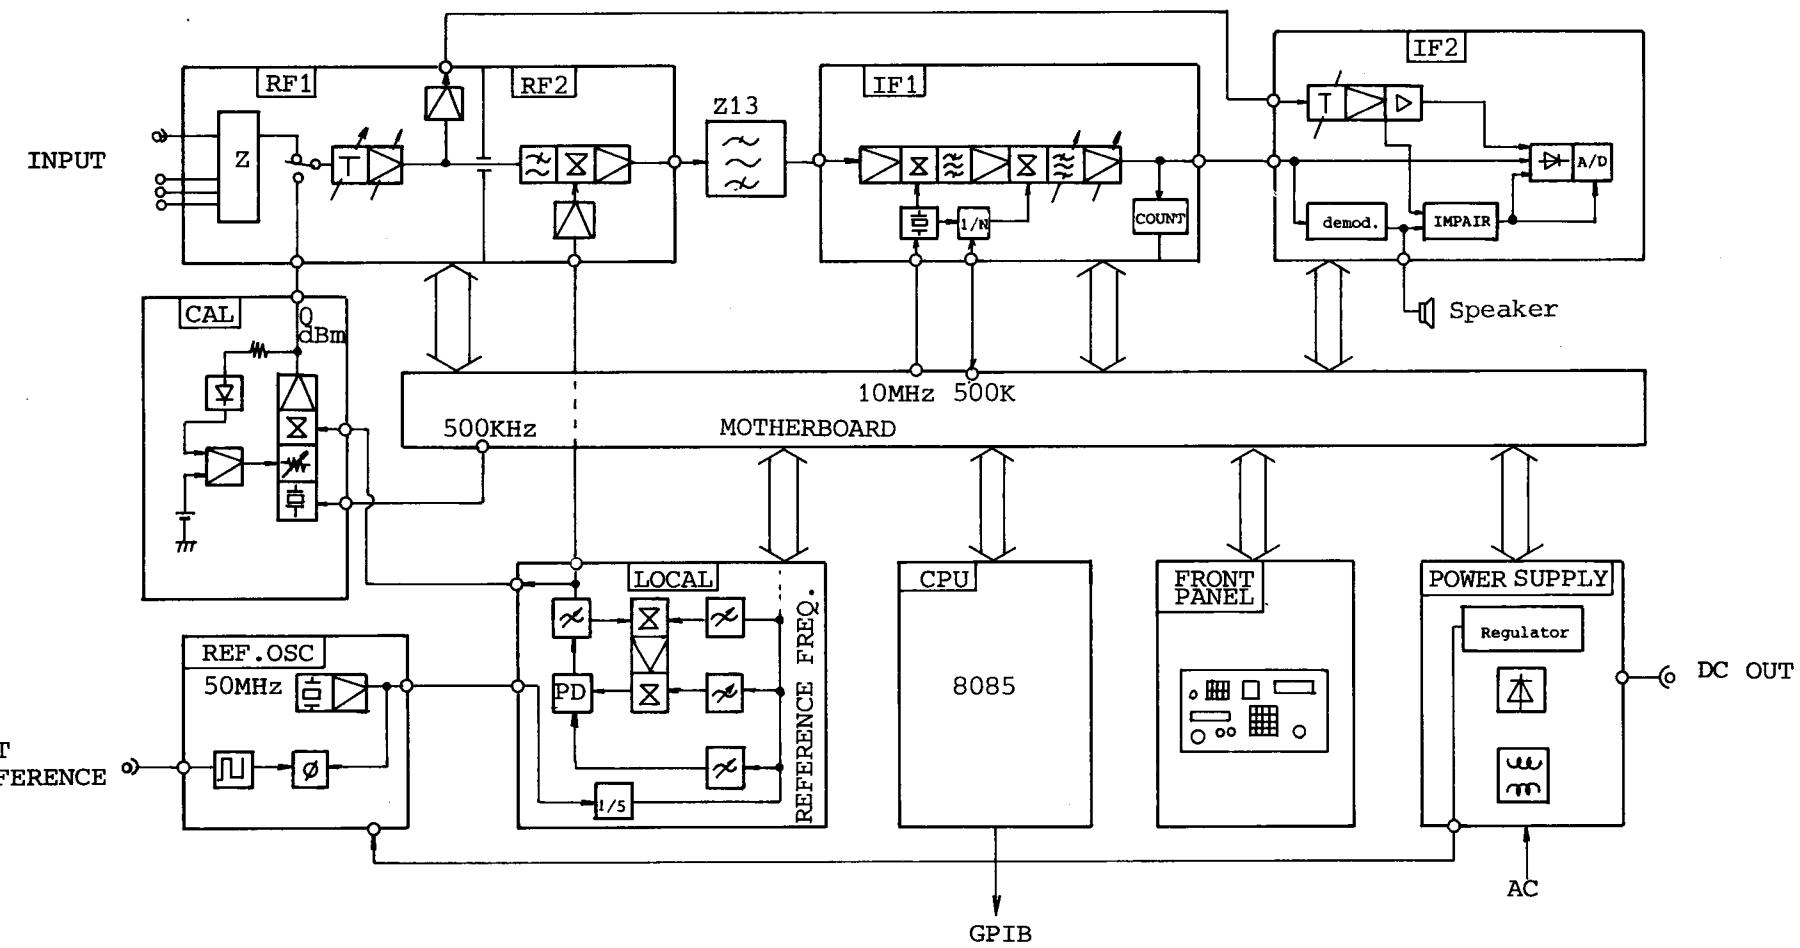

Fig. 2-16 Block Diagram of ML422B/C

### 2.2.2 IF Section

In the IF section, the 56.6 MHz IF signal is converted to the 600 kHz, second IF signal by using the second local signal of 56 MHz.

The second IF signal proceeds to the band pass filter which has 48 kHz bandwidth and determines the selective bandwidth of the ML422B/C.

The signal is mixed by 560 kHz or 625 kHz and converted to the 40 kHz or 25 kHz, third IF frequency.

560 kHz is obtained by dividing 56 MHz into 1/100, while the 625 kHz is obtained by dividing 5 MHz into 1/8.

The 25 kHz signal is applied to the band pass filter with the bandwidth of 20 Hz and 3.1 kHz.

This 3rd IF signal is detected as an r.m.s value, and the detected signal is converted to the digital value by a 12 bit A/D converter.

There is a 75 dB variable attenuator, variable in 5 dB steps, located in the 3rd IF section which functions to assist the RF section attenuator.

### 2.2.3 LOCAL Section

This crystal-controlled, synthesized oscillator and functions as the first local oscillator.

This oscillator covers the frequency range from 56.6 to 86.6 MHz in 1 Hz steps, comprising a four-phase Locked Loop Circuit.

In addition, the local section provides a 10 MHz standard signal to the IF section through a tuning filter.

#### **2.2.4 CPU Section**

The CPU section provides the control signals to RF, IF, LOCAL and FRONT PANEL sections by means of microprocessors.

In addition, measurement data manipulation can be performed in this section. Interface processing to peripheral devices is also conducted through this CPU section.

#### **2.2.5 FRONT PANEL Section**

This section is the interface between the selective level meter and operator.

The operator can control the selective level meter functions through the controls, and read and store the necessary data easily.

#### **2.2.6 POWER SUPPLY Section**

The POWER SUPPLY provides the required regulated DC voltages to the circuits in the instruments.

The ac line voltage can be changed to both 100 to 127 V and 200 to 254 V.

#### **2.2.7 Circuit Reference**

All printed circuit boards in the ML422B/C have designations beginning with the "Z". Table 2-1 lists the designations for all printed circuit boards of the circuit section. Their location numbers are given in Figs. 2-2 to 2-12, and their schematic numbers in SECTION 4.

Table 2-1 Circuit Reference

**SECTION 3**  
**ADJUSTMENTS**

## SECTION 3

### ADJUSTMENTS

#### 3.1 Introduction

This section details the adjustment procedures for each component of the ML422B/C. These adjustments are required if an abnormal condition is detected in the periodic performance check or if an error occurs or a part is replaced.

Usually, the following items must be adjusted:

- Reference frequency
- Level measuring accuracy

These items can be adjusted by removing the top and bottom covers of the ML422B/C.

To adjust other items, an extender board and extender cables, contained in the service kit (optional accessory), are required.

#### 3.2 Items for Adjustment

Table 3-1 shows adjustment items, adjustment locations, and the equipment required. From this Table, it can be determined what should be adjusted if an abnormal condition is detected in the performance check.

Table 3-1 Adjustment

Item	Location	Equipment required	Requirement of performance check
1. Frequency (Reference)	REFERENCE OSC (Z5) : R53	Anritsu MG545 [ ] Frequency synthesizer with option 03	Paragraph 5.2 in operation manual
2. Level accuracy (1) absolute level	CAL (Z2) : R95	Anritsu ML423A Standard Level meter	Paragraph 5.3 in operation manual
(2) RF ATT (include STEP AMPL)	RF1 (Z1) : R18 } R25 } -20 dB L10 } C27 } R19 } R26 } -40 dB L11 } C28 } R40 } +10 dB C37 } R49 } -5 dB C49 } R57 } C58 } +10 dB	Anritsu MS420A Network/Spectrum Analyzer and Standard resistance attenuator	
(3) IF ATT (STEP AMPL)	IF1 (Z8) : [ R56---- 5 dB R54----15 dB R73----+10 dB R74----+20 dB R75----+30 dB	Standard Resistance Attenuator

### 3.3 Adjustment Procedures

#### 3.3.1 Frequency

##### Setup

##### Procedure

1) Set the MG545[ ] as follows:

Frequency : 30 MHz  
Level : 0 dBm  
Impedance :  $75\Omega$

2) Set the M422B/C as follows:

Frequency : 30 MHz  
BW : 3.1 kHz or 48 kHz  
AFC : ON  
INPUT :  $75\Omega$ , UNBALANCED, TERMINATED  
Full scale: 0 dBm

3) Adjust R53 of REFERENCE OSC (Z5) so that the FREQUENCY display indicates 30,000,000 Hz.

#### 3.3.2 Level accuracy

Level accuracy can be adjusted by adjusting RF1, (RF2), CAL, IF1 and IF2 circuit. These circuits are associated with the following functions:

- Absolute level shifting (UBBLANCED) : CAL  
(BALANCED) : IF2
- TUNING INDICATOR indication is : RF1  
changed when changing the frequency

- Low accuracy at specific full scale
  - ( $\geq -50$  dBm) : RF1 (ATT)
  - (< -50 dBm) : IF1 (ATT)
- Linearity: IF2
- The MEASUREMENT display value is correct, but the TUNING INDICATOR value is much incorrect <sup>\*1</sup>.
  - (TUNING INDICATOR display is changed when changing the frequency): RF1, RF2
  - (TUNING INDICATOR remains unchanged when changing the frequency): IF2
- TUNING INDICATOR display is changed when changing the frequency. (only at WIDEBAND) : IF2 <sup>\*2</sup>
- TUNING INDICATOR remains unchanged when changing the frequency) (only at BALANCED): RF1 <sup>\*2</sup>

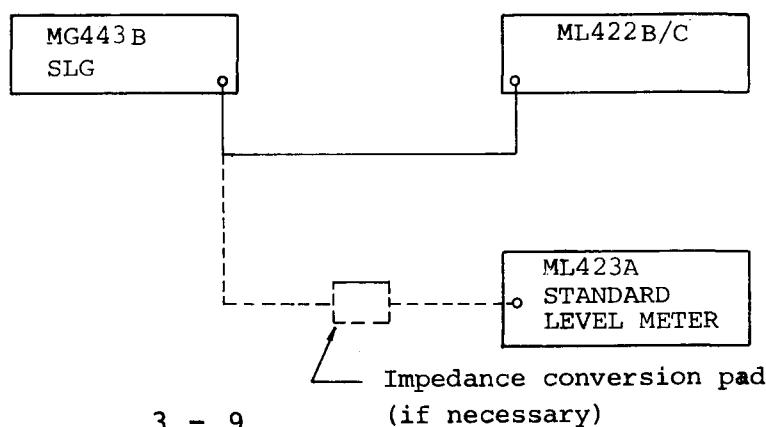

Check which function is affected, and locate the circuit which should be adjusted for the level accuracy adjustment.

<sup>\*1</sup> In this case, it can be considered that any of RF1, RF2, and IF2 has a malfunction. Check the level on these circuits as explained in SECTION 4.

<sup>\*2</sup> See Table 3-1, and adjust by using the same setup as explained in SECTION 5 PERFORMANCE CHECK in Operation Manual.

#### (1) Absolute level

##### Setup

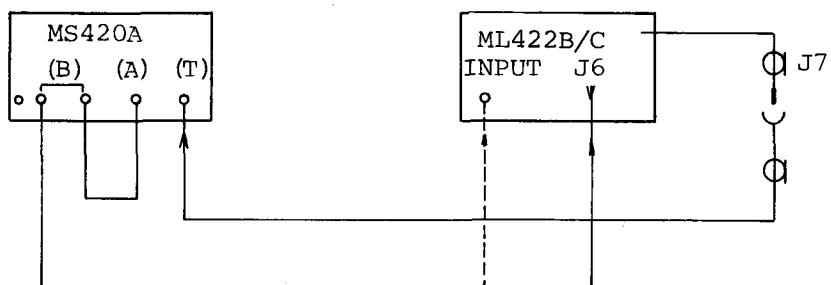

Procedure

- 1) Set the MG443B as follows:  
Frequency: 100 kHz  
Level : +5 dBm  
Impedance: Same value as that of ML422B/C
- 2) Perform internal calibration of the ML423A.
- 3) Set the ML422B/C as follows:  
Frequency : 100 kHz  
Full scale : +5 dBm  
Selective BW: 20 Hz  
Impedance : TERMINATED, 75Ω, UNBALANCED
- 4) Using the ML423A, calibrate the MG443B output level absolute value to 5.00 dB.
- 5) Supply the calibrated signal to the ML422B/C , and adjust the R95 of CAL (Z2) so that the measured value is 5.00 dBm. (When the BW 20 Hz key is pressed, ML422B/C internal calibration is performed. Adjust so that the measured value after calibration is 5.00 dB.)
- 6) Switch the ML422B/C input impedance and repeat the calibration explained in Steps 4) and 5). In this case, the following variable resistors must be adjusted.

Impedance	Adjustment: IF2 (Z9)
BALANCED 75 Ω	R95
BALANCED 124 Ω (135Ω)	R96
BALANCED 150 Ω (135Ω)	R97
BALANCED 600 Ω	R98

(2) Frequency response

Setup

Procedure

- 1) Set the MS420A as follows:

Frequency : 10 kHz to 20 MHz

Output level: -30 dBm

- 2) Set the ML422B/C as follows:

Selective BW: 3.1 kHz

Full scale : -30 dBm

Impedance :  $75\Omega$ , UNBALANCED, TERMINATED

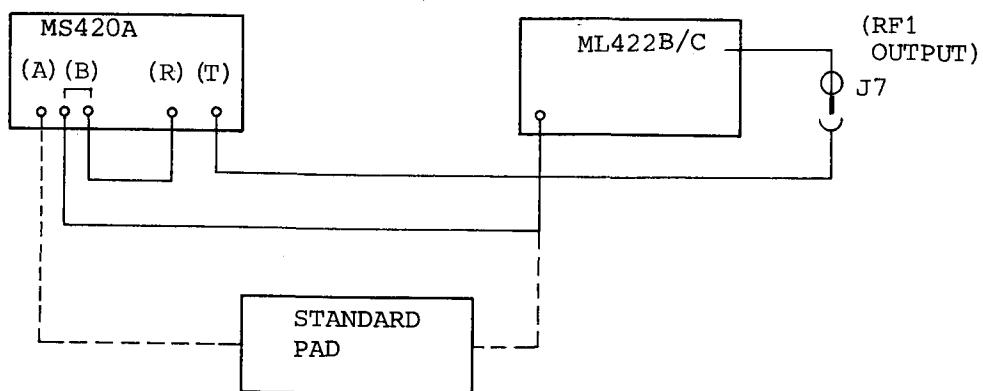

- 3) Remove J5 from RF1 (Z1) CAL INPUT J6 of the ML422B/C, and connect an extender cable to J6.

- 4) Remove the cable which connects RF1 (Z1) to IF2 (Z9) in the ML422B/C. Connect J7 to the MS420A INPUT (T) through an extender cable.

- 5) Connect the MS420A OUTPUT (B) to the INPUT connector of the ML422B/C, measure the frequency response, and store the result, as the S data, into the memory of the MS420A.

- 6) Connect the MS420A OUTPUT (B) to ML422B/C RF1 (Z1) J6 through an extender cable, and measure the frequency response (this result is treated as X data). Adjust R14, R17, L8, and L9 of RF1 (Z1) so that the X-S value becomes flat.
- (3) Frequency response (RF ATT)

Setup

Procedure

- 1) Set the MS420A (NWA) as follows:  
Frequency: 10 kHz to 30 kHz
- 2) Set the ML422B/C as follows:  
Frequency: 10 kHz  
Selective BW: 3.1 kHz  
Full scale AUTO: OFF  
Impedance: 75Ω, UNBALANCED, TERMINATED
- 3) Remove the cable (J7) which connects RF1 (Z1) to IF2 (Z9) in the ML422B/C . Connect J7 to the MS420A INPUT (T) through an extender cable.
- 4) Adjust the absolute value of attenuation by using the standard pad at the 10 kHz. ( $\pm 0.01$  dB)

Adjust the frequency response by sweeping the NWA. ( $\pm 0.02$  dB)

Adjustment of 0/20/40 dB RF ATT

		0/20/40 dB RF ATT	
Full scale (ML422B/C)	Attenuation	Adjustment: RF1 (Z1)	
		10 kHz	1 MHz ~ 30 MHz
+10 dBm	40 dB	R26	R19, L11, C28
-10 dBm	20 dB	R25	R18, L10, C27
-30 dBm	0 dB	Reference	

Adjustment of 0/10 dB RF STEP AMPL. 1

		0/10 dB RF STEP AMPL 1	
Full scale (ML422B/C)	GAIN	Adjustment: RF1 (Z1)	
		10 kHz	1 MHz to 30 MHz
-10 dBm	0 dB	Reference	
-20 dBm	+10 dB	R40	C37, (L17, R41)

Adjustment of 0/5 dB RF ATT

		0/5 dB RFATT	
Full scale (ML422B/C)	Attenuation	Adjustment: RF 1 (Z1)	
		10 kHz	1 MHz to 30 MHz
-15 dBm	5 dB	R49	C49
-20 dBm	0 dB	Reference	

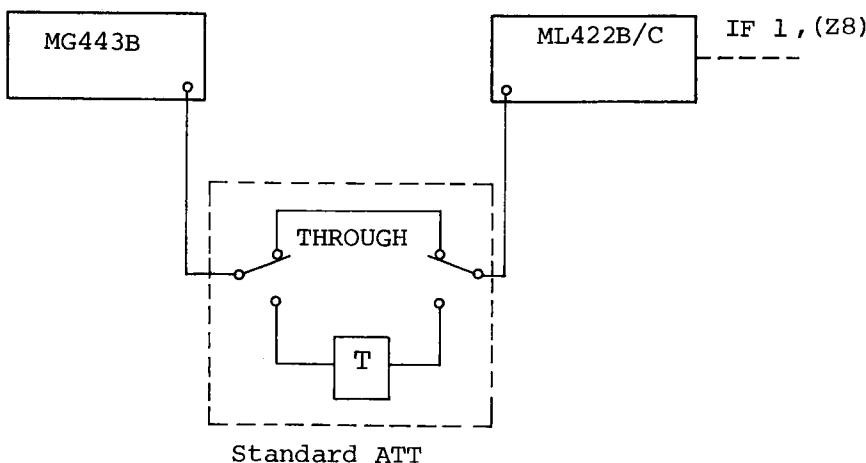

Adjustment of 0/10 dB RF STEP AMPL 2

		0/10 dB RF STEP AMPL 2	
Full scale (ML422B/C)	GAIN	Adjustment: RF1 (Z1)	
		10 kHz	1 MHz to 30 MHz
-40 dBm	0 dB	Reference	
-50 dBm	+10 dB	R57	C58 (L18, R58, R59)

- 5) Adjust C57 of RF1 (Z1) so that the frequency response of ML422B/C RF1 is within  $\pm 0.1$  dB.

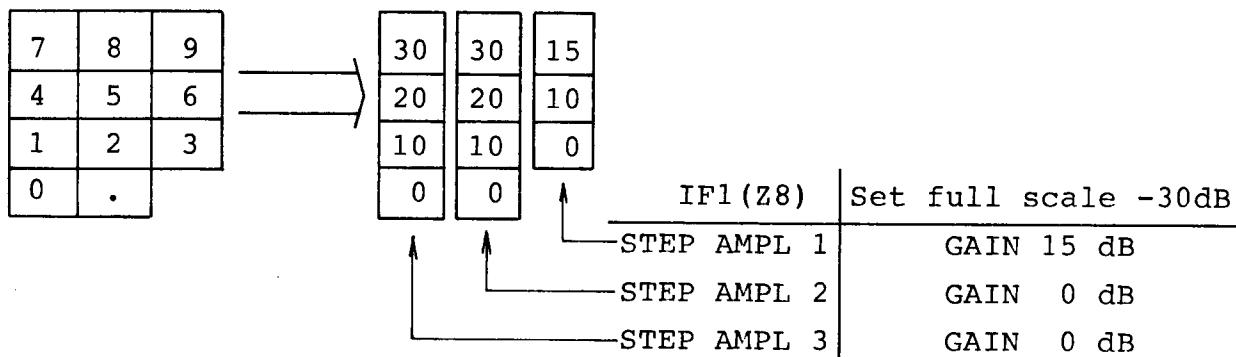

(4) IF ATT

Setup

Procedure

- 1) Set the MG443B as follows:  
Frequency: 10 kHz  
Impedance:  $75\Omega$  UNBALANCED  
Output level: -15 dBm or -30 dBm
- 2) Connect the No. 6 pin (TEST) of Q99 on IF2 (Z9) of ML422B/C to GND. After this connection, IF ATT (STEP AMPL) can be controlled directly from the ten-key pad (keys "." and "0" through "9").

3) Set the ML422B/C as follows:

Frequency: 10 kHz

Impedance:  $75\Omega$ , UNBALANCED, TERMINATED

Selective BW: 20 Hz

Full scale: -30 dBm

4) Switch the standard ATT and at the same time, switch the STEP AMPL gain by using the ten-key pad, and adjust STEP AMPL 1 through 3 so that the MEASUREMENT display displays the same value is standard ATT. Before adjusting each STEP AMPL, always set the following:

FULL SCALE	3	0	-dB
------------	---	---	-----

STEP AMPL 1

MG443B OUT-put level	Standard ATT	STEP AMPL Gain	Adjustment IF1 (Z8)
-15 dBm	15 dB	15 dB <b>9</b>	Reference
	10 dB	10 dB <b>6</b>	R56
	0 dB	0 dB <b>3</b>	R54

STEP AMPL 2

MG443B out-put level	Standard ATT	STEP AMPL Gain	Adjustment IF1 (Z8)
-30 dBm	0 dB	0 dB <b>.</b>	Reference
	10 dB	10 dB <b>2</b>	R73
	20 dB	20 dB <b>5</b>	R74
	30 dB	30 dB <b>8</b>	R75

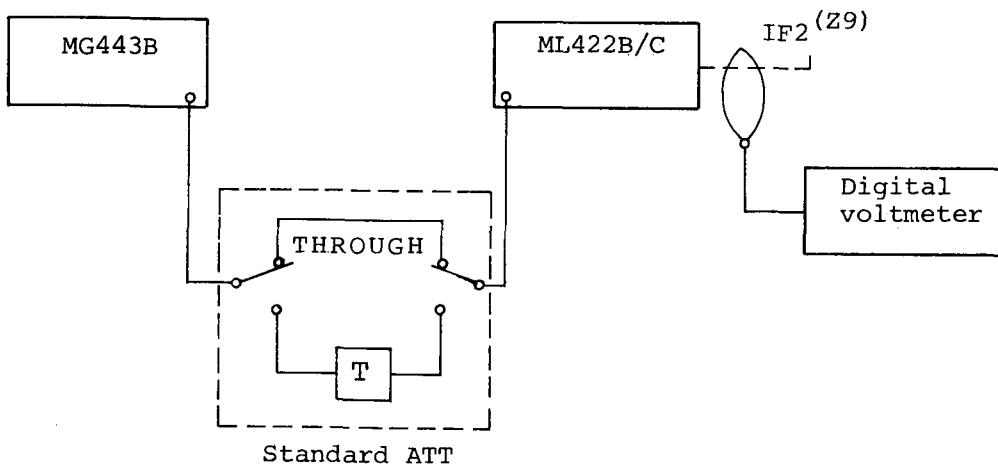

### STEP AMPL 3

MG443B Out- put level	Standard ATT	STEP AMPL Gain	Adjustment IF1 (Z8)
-30 dBm	0 dB	0 dB <input type="text" value="0"/>	Reference
	10 dB	10 dB <input type="text" value="1"/>	R116
	-20 dB	20 dB <input type="text" value="4"/>	R117
	30 dB	30 dB <input type="text" value="7"/>	R118

- 5) Release the test connection made in Step 2), and set the original connection.

### (5) A/D linearity

#### Setup

#### Procedure

- 1) Set the MG443B as follows:

Frequency: 10 kHz

Impedance: 75 Ω, UNBALANCED

Output level: 0 dBm

- 2) Connect the No. 6 pin (TEST) of Q99 on IF2 (Z9) of ML422B/C to GND. After this connection, internal calibration is not performed.

- 3) Set the ML422B/C as follows:

Frequency: 10 kHz

Selective BW: 20 Hz

Impedance: 75 Ω, UNBALANCED, TERMINATED

Full scale: 0dBm

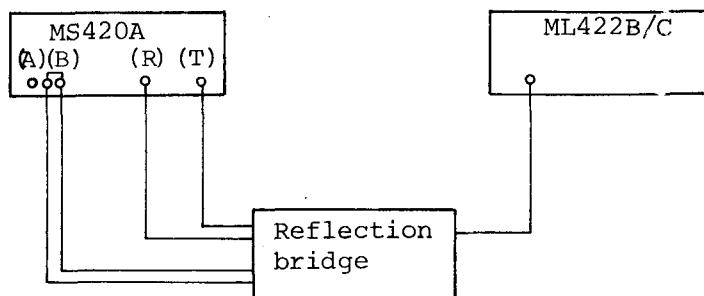

Scale range: 20 dB

- 4) Set the standard ATT to the THROUGH position.
- 5) Adjust the MG443B output level so that the output voltage at the No. 14 pin of Q87 on IF2 (Z9) is 1.800 V.
- 6) Adjust R298 of IF2 (Z9) so that the MEASUREMENT display displays 0.00 dB.
- 7) Adjust the MG443B output level so that the output voltage at the No. 14 pin of Q87 on IF2 (Z9) is 0.100 V. (-17 dBm)
- 8) Adjust R304 of IF2 (Z9) so that the MEASUREMENT display displays -17.00 dB.
- 9) Adjust the MG443B output level so that the output voltage at the No. 14 pin of Q87 on IF2 (Z9) is 1.997 V.
- 10) Adjust R300 of IF2 (Z9) so that the measurement display indicates +1.97 dB.
- 11) Repeat Steps 5) through 10).
- 12) Set the MG443B output level to 0 dBm, and set the standard ATT to the THROUGH position. Let the MEASUREMENT display value be S dBm.
- 13) Set the standard ATT to 10 dB. Let the MEASUREMENT display value in this case be X dBm.
- 14) Adjust R310 of IF2 (Z9) so that X-S is -10.00 dB. If this value cannot be obtained, adjust both R310 and R285.
- 15) Repeat Steps 12) through 14).

- 16) Set the standard ATT to the THROUGH position.
- 17) Adjust R259 of IF2 (Z9) so that the MEASUREMENT display displays 0.00 dBm.
- 18) Set the SCALE RANGE of the ML422B/C to 100 dB.
- 19) Let the MEASUREMENT display value (displayed when the standard ATT is set to THROUGH position S dBm).
- 20) Let the MEASUREMENT display value (displayed when the standard ATT is set to 50 dB) be X dBm.
- 21) Adjust R292 of IF2 (Z9) so that X-S is -50.0 dB.
- 22) Repeat Steps 19) through 21).
- 23) Adjust R282 of IF2 (Z9) so that the MEASUREMENT display displays 0.0 dBm when the standard ATT is set to the THROUGH position.
- 24) Set the ML422B/C to WIDEBAND and SCALE RANGE 20 dB.
- 25) Perform the same procedure as in Steps 12) and 13).
- 26) Adjust R312 of IF2 (Z9) so that X-S is -15.00 dB.
- 27) Repeat Steps 25) and 26).
- 28) Adjust R314 of IF2 (Z9) so that the MEASUREMENT display displays 0.00 dB when the standard ATT is set to the THROUGH position.
- 29) Set the SCALE RANGE of the ML422B/C to 100 dB.
- 30) Adjust R41 of IF2 (Z9) so that the MEASUREMENT display indicates -40.0 dBm when the standard ATT is set to 40 dB.
- 31) Repeat steps 26) to 30)
- 32) Release the test connection made in Step 2) and set the original connection.

### 3.3.3 Input Impedance

#### Setup

#### Procedure

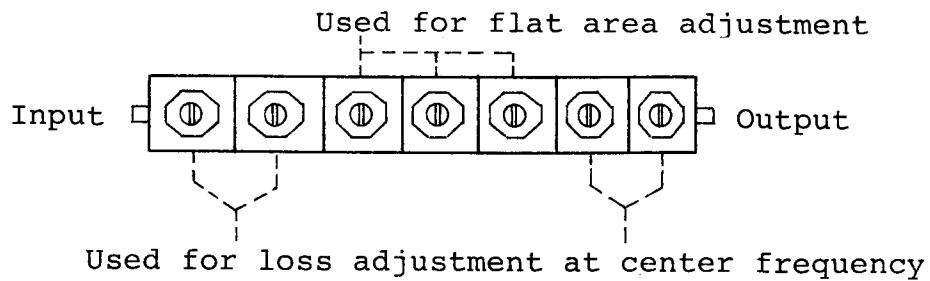

- 1) Set the MS420A as follows:  
Frequency: 10 kHz to 30 MHz  
Output level: 0 dBm
- 2) Set the ML422 B/C as follows:  
Frequency scale: 0 dBm  
Impedance:  $75\Omega$ , UNBALANCED, TERMINATED
- 3) Adjust L1 and R1 of RF1 ( $Z_1$ ) so that the return loss satisfies the specifications (see Table 2-2 in Operation Manual).
- 4) Switching the ML422B/C FULL SCALE to -10 dBm and then -30 dBm, check whether or not the specifications are satisfied.

### 3.3.4 Selectivity

#### (1) 56.6 MHz, first IF BPF

##### Procedure

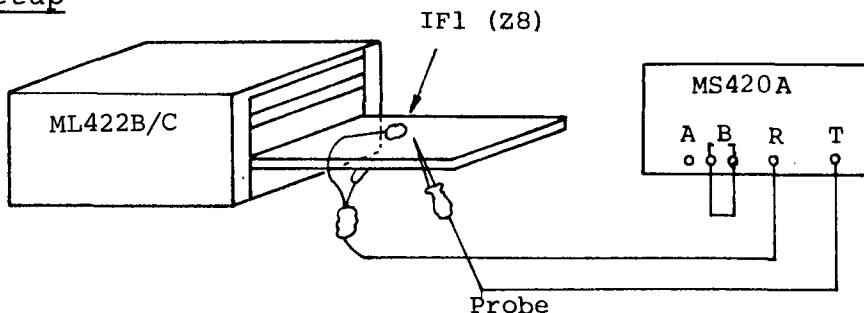

- 1) Disconnect the cable (J8, J9) connected to 56.6 MHz first IF BPF (Z13), and connect the BPF to the Network Analyzer ME537J with an extender cable.
- 2) Adjust 7 adjusters so that the loss at center frequency 56.6 MHz is approx. 10 dB.
- 3) Adjust the adjusters 3 of center so that the flat frequency response (within  $\pm 0.01$  dB) are obtained at  $56.6 \text{ MHz} \pm 40 \text{ kHz}$ .

- 5) Check whether the loss is  $10 \text{ dB} \pm 1 \text{ dB}$ .

#### (2) 20 Hz BPF

##### Setup

##### Procedure

- 1) Disconnect the IF1 (Z8) C50 negative terminal, and connect the MS420A output (level: -30 dBm) to it.
- 2) Set the ML422B/C, so that the selective BW is 20 Hz and the FULL SCALE is 0 dBm.

- 3) Using a high-impedance probe, connect the MS420A INPUT (T) terminal to the following test points, and adjust the following controls. The MS420A center frequency must be set to 25 kHz and the SPAN must be 20 Hz.

Adjustment		Test point	
1	R176	R181	Q63, No.1 pin
2	R186	R191	Q65, No.1 pin
3	R203	R204	Q66, No.1 pin

- 4) Check whether the following specifications are satisfied:

0.5 dB:  $\geq 6$  Hz

3 dB :  $16$  Hz  $\pm 20\%$

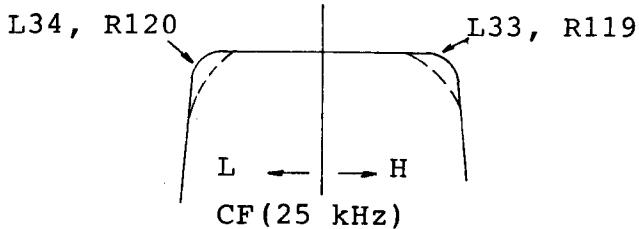

45 dB : within  $\pm 35$  Hz

60 dB : within  $\pm 70$  Hz

80 dB : within  $\pm 2$  kHz

- 5) Connect the high-impedance probe to ⑯ of IF1 (Z8).
- 6) Using R60, adjust gain and loss at BW switching.
- 7) Connect the high-impedance probe to ⑯ of IF1 (Z8).
- 8) Switch the selective BW to 48 kHz, and adjust L35 so that the null point (-0.05 dB) is located at 24.976 kHz.
- 9) Switch the selective BW to 3.1 kHz.

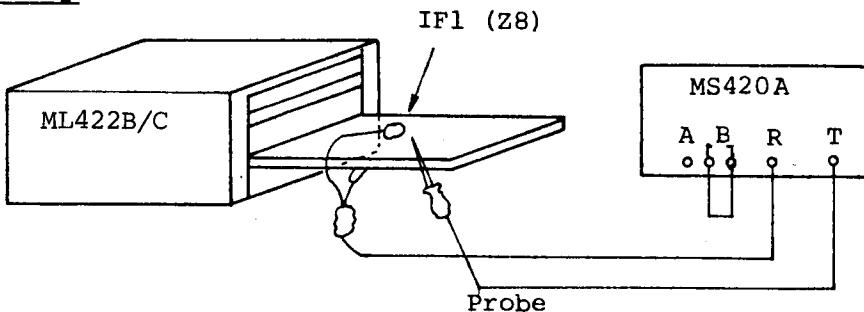

- 10) Adjust L33, L34, R119 and R120 so that the 3 dB bandwidth satisfies the specifications (see Table 2-2 in Operation Manual).

- 11) Using R78, adjust gain and loss at BW switching.

3) 3.1 kHz BPF

Setup

Procedure

- 1) Disconnect the IF1 (Z8) C50 negative terminal, and connect the MS420A output (level: -30 dBm) to it.
- 2) Using a high-impedance probe, connect the MS420A INPUT (T) terminal to the No. 6 pin of Q14 on IF1 (Z8).
- 3) Set the ML422B/C so that the selective BW is 3.1 kHz and the FULL SCALE is 0 dBm.
- 4) Using L20 through L31, adjust the null frequency in the order as shown below. These adjustments must be performed twice respectively.

Adjustment	Null frequency
L20	26.930 kHz
L21	23.087 kHz
L22	27.618 kHz
L23	22.512 kHz
L24	26.841 kHz
L25	23.163 kHz
L26	26.807 kHz
L27	23.193 kHz
L28	29.135 kHz
L29	21.340 kHz
L30	27.131 kHz
L31	22.916 kHz

- 5) Adjust L19 and L32 so that the single peak response and symmetry about the peak are obtained.
- 6) Check whether or not the following specifications are satisfied:

0.5 dB:  $\geq 1.5$  kHz

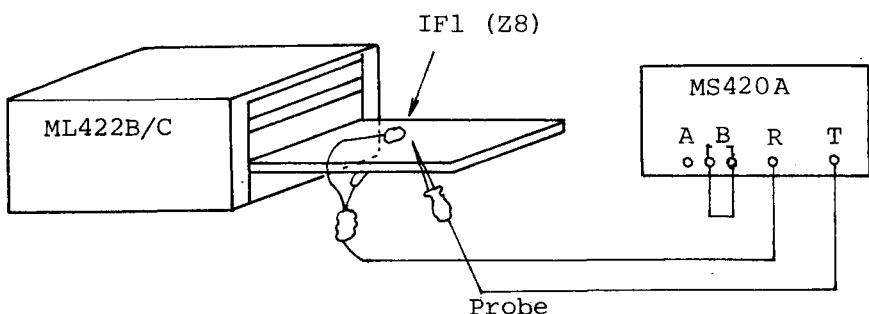

3 dB :  $3.1$  kHz  $\pm 10\%$

60 dB : within  $\pm 1.85$  kHz

65 dB : within  $\pm 2.4$  kHz

#### (4) 48 kHz BPF

##### Setup

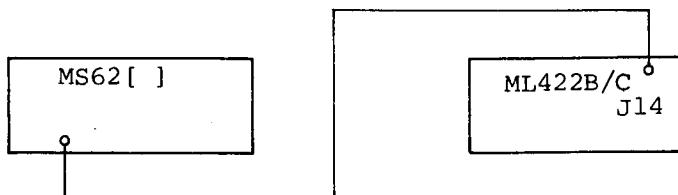

### Procedure

- 1) Disconnect the T1-side terminal of IF1 (Z8) C19, and connect the MS420A output (level: -10 dBm) to it.
- 2) Using a high-impedance probe, connect the MS420A INPUT (T) terminal to the No. 8 pin of IF1 (Z8).
- 3) Set the ML422B/C so that the full scale is 0 dBm.
- 4) Using L6, L7, L9, L10, L12, L13, L15 and L16, adjust the null frequency in the order shown below. This adjustment must be performed twice, respectively.

Adjustment	Null frequency
L6	553.170 kHz
L7	648.700 kHz
L9	565.280 kHz
L10	634.750 kHz
L12	562.320 kHz
L13	638.100 kHz
L15	518.430 kHz
L16	689.640 kHz

### (5) LOCAL C/N (LOCAL Carrier to Noise ratio)

### Setup

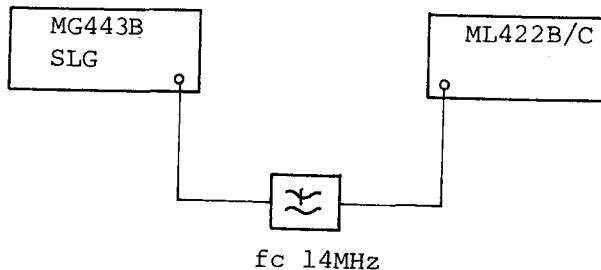

### Procedure

- 1) Disconnect the cable (J13) which connects ML422 B/C RF2 (Z3) to LOCAL (Z4).  
Using an extender cable, connect the MS62 [ ] to J14.
- 2) Set the ML422B/C as follows:  
Frequency: 30 MHz
- 3) Using the MS62[ ], receive the 86.6 MHz local signal from ML422 B/C . Then, set the MS62 [ ] as follows:  
BW: 300 Hz  
V: 10 dB/div  
H: 2 kHz/div  
Phase lock: ON
- 4) Adjust R198 and R199 (and R133 and R181 as required) so that the C/N value AT A POINT  $\pm 0.5$  kHz to 10 kHz distant from the carries is improved (approx. 75 dB).

#### 3.3.5 Intrinsic Distortion

##### Setup

### Procedure

- 1) Set the MG443B as follows:  
Frequency: 12 MHz  
Impedance:  $75\Omega$ , UNBALANCED  
Level: -5 dBm
- 2) Set the ML422B/C as follows:  
Frequency: 12 MHz  
Full scale: AUTO  
Scale range: 100 dB  
Selective BW: 20 Hz
- 3) Check the 12 MHz fundamental wave level, and set the frequency to the second harmonic frequency.
- 4) Adjust R31, R120 and R52 on RF1 (Z1) and R2 on RF2 (Z2) so that the internal distortion satisfies the specifications (see Table 2-2 in Operation Manual).

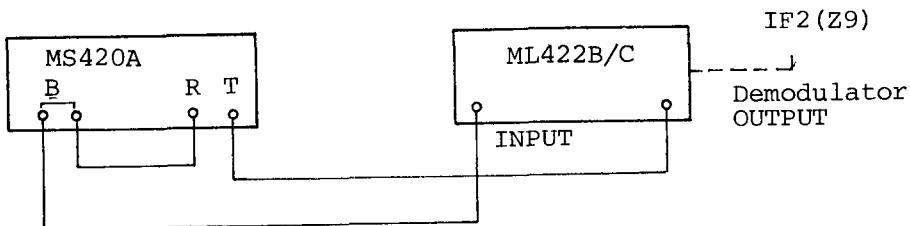

#### 3.3.6 Phase Jitter

### Procedure

- 1) Set the MG443B output level to 0 dBm.
- 2) Apply the 160 Hz phase modulation (PM) to the MG443B output, and adjust the 30 degree (P-P) sensitivity by using R167 of IF2 (Z9).
- 3) Using R162 of IF2 (Z9), adjust the 0.5 degree (P-P) sensitivity.
- 4) Repeat Steps 2) and 3).
- 5) Apply the 20 Hz PM to the MG443B output, and adjust the sensitivity by using R125.

### 3.3.7 Notch Filter

#### Setup

#### Procedure

- 1) Set the MS420A as follows:

Frequency: 300 Hz to 3.4 kHz

Output level: 0 dBm

RBW: 100 Hz

- 2) Set the ML422B/C as follows:

Frequency: 1.85 kHz

Selective BW: 3.1 kHz, NOISE TONE

Demodulator: USB

Scale range: 100 dB

Full scale: 0 dB

Impedance: 75Ω, UNBALANCED, TERMINATED

After this setting, press the FREQ key to stop the measurement.

- 3) Execute sweep with the MS420A from 300 Hz to 3.4 kHz.
- 4) Adjust the notch filter by using R221, R230 and R239 of IF2 (Z9).

### 3.3.8 Impulse Noise

#### Procedure

- 1) Set TIME to 1 minute, input a signal which exceeds the threshold level, and adjust R278 of IF2 (Z9) so that the COUNT value is 420 (for the ML422B) or 480 (for the ML422C).
- 2) Adjust R346 of IF2 (Z9) so that counting is performed when a signal which exceeds the threshold level by 1 dB is applied and counting is stopped when a signal which 1 dB lower is applied.

Before this adjustment, the adjustment explained in Paragraph 3.3.9 must be performed.

### 3.3.9 Tone Search Threshold Level

#### Procedure

- 1) Set the threshold level to -20 dBm.
- 2) Measure the output voltage at the No. 1 pin of Q66 on IF2 (Z9). Let this voltage be T volt.
- 3) Set the threshold level to 0 dBm.
- 4) Adjust R273 so that the output voltage at the No. 1 pin of Q66 on IF2 (Z9) is  $100 \times T$  volt.
- 5) Adjust R265 so that the voltage at the No. 7 pin of Q83 on IF2 (Z9) is equal to the TTL high level when the +0.5 dBm singal is received and the voltage is equal to the TTL low level when the -0.5 dBm signal is received.

**SECTION 4**

**TROUBLESHOOTING AND CIRCUITRY**

## SECTION 4

### TROUBLESHOOTING AND CIRCUITRY

#### 4.1 Introduction

This section details the procedures for troubleshooting and circuitry. Troubleshooting can be outlined as follows:

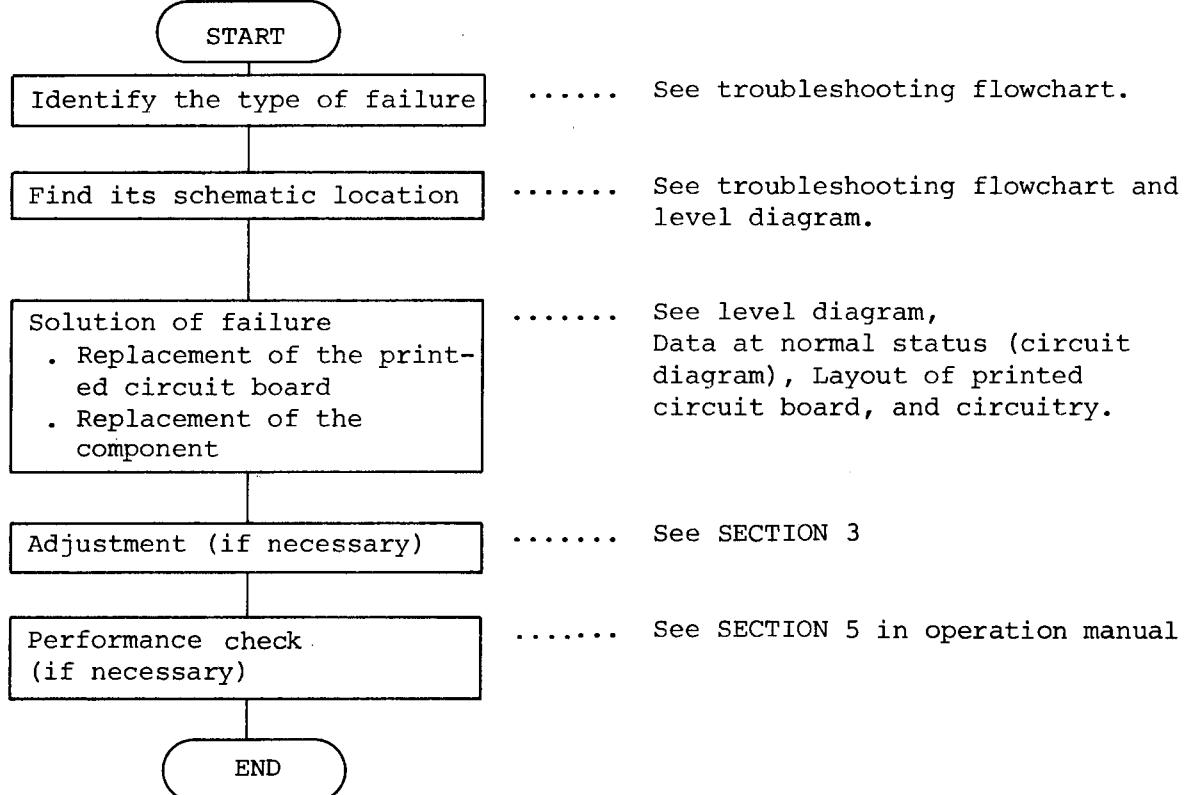

Fig. 4-1 Troubleshooting and Repair Procedures

#### 4.2 Troubleshooting Flowcharts

Figure 4-2 shows troubleshooting flowcharts. Table 4-1 shows the relationship between malfunctions and estimated faulty locations.

If malfunction occurs, find the faulty location by using these figures and the Table. Next, find the faulty component according to the normal voltage, waveform, level, and frequency shown in the corresponding circuit diagram and by using the level diagram.

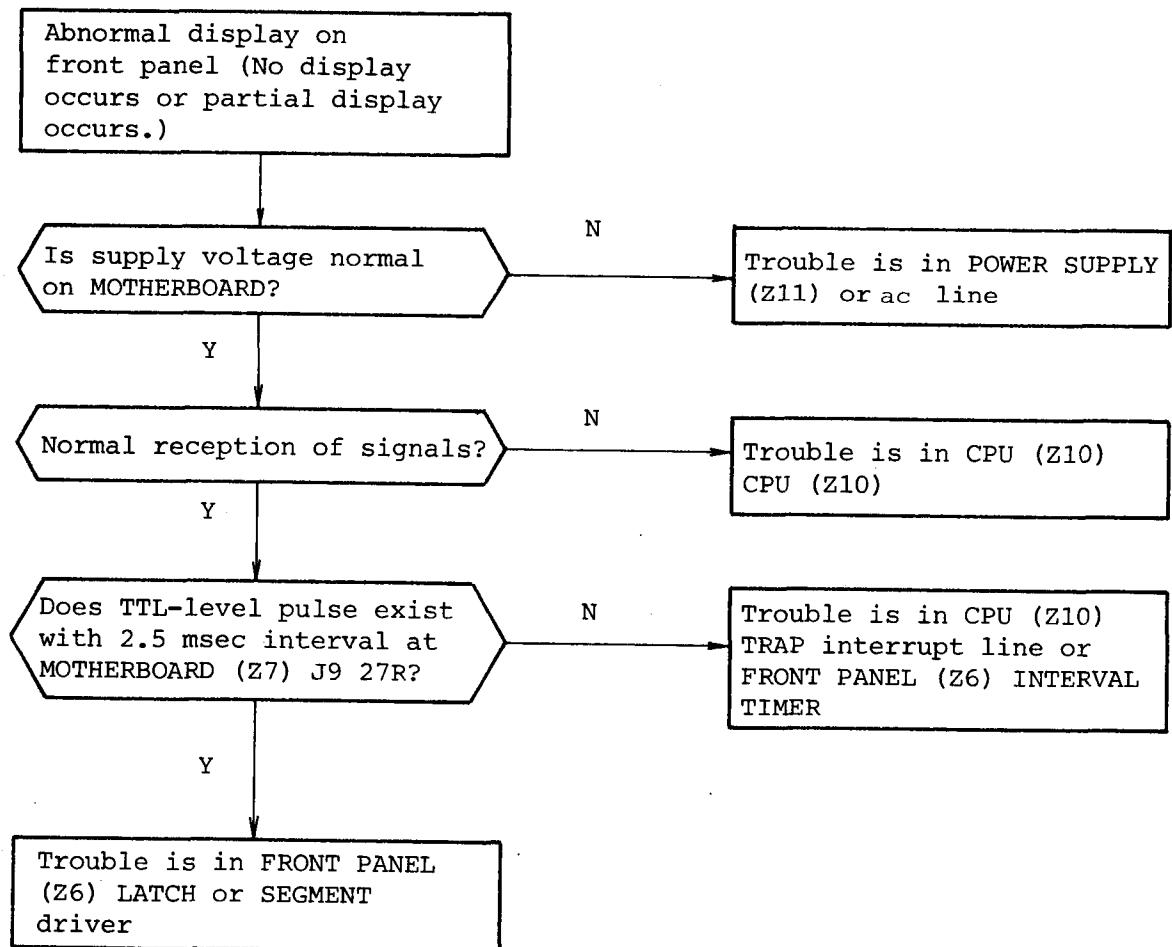

Fig. 4-2 (a) Troubleshooting Flowchart 1

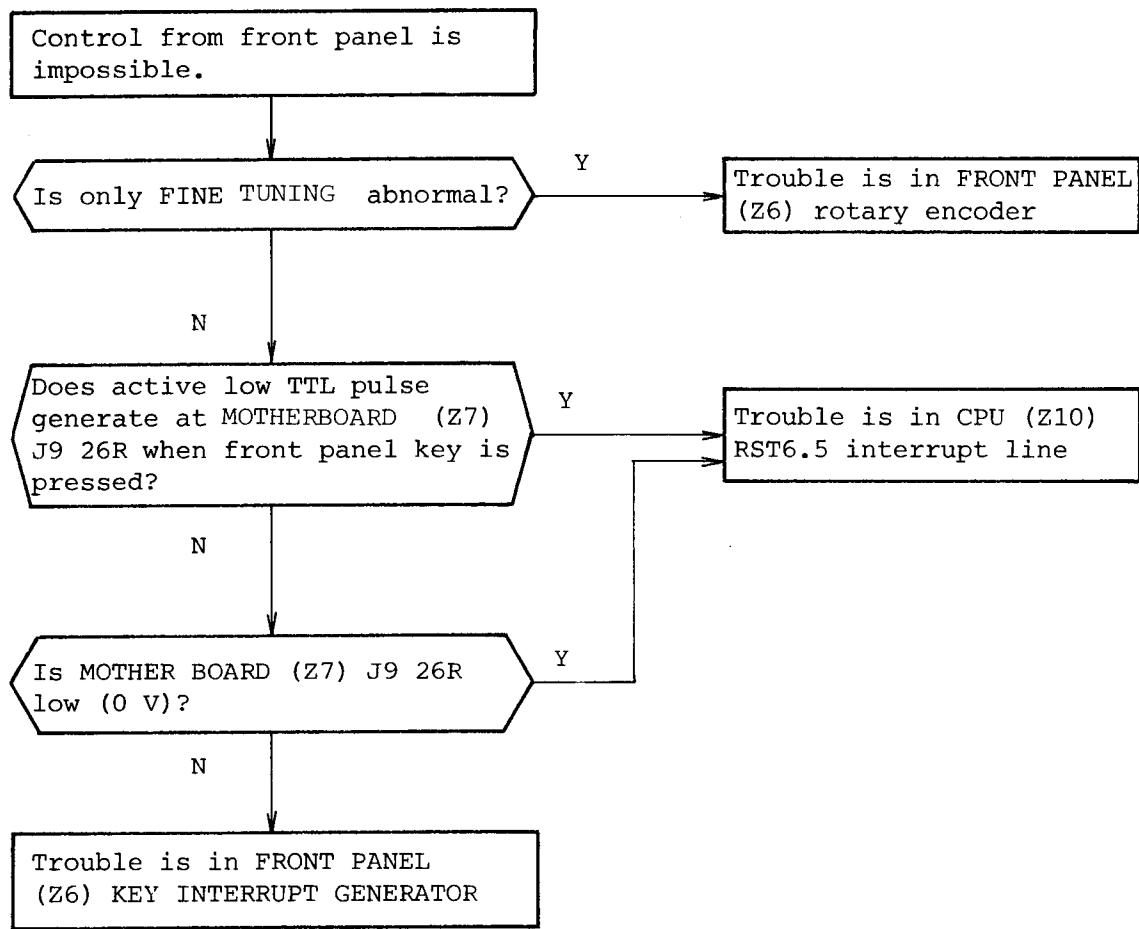

Fig. 4-2 (b) Troubleshooting Flowchart 2

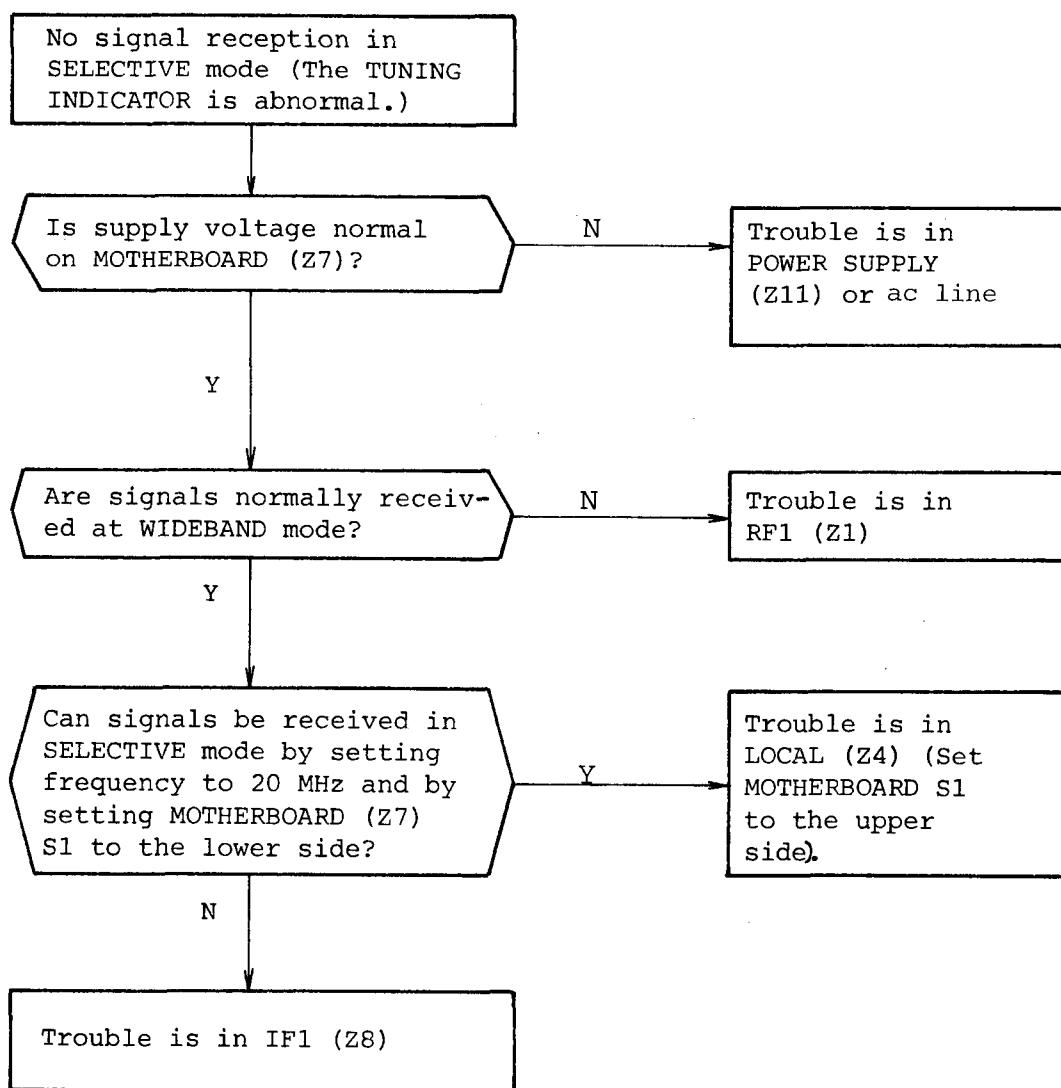

Fig. 4-2 (c) Troubleshooting Flowchart 3

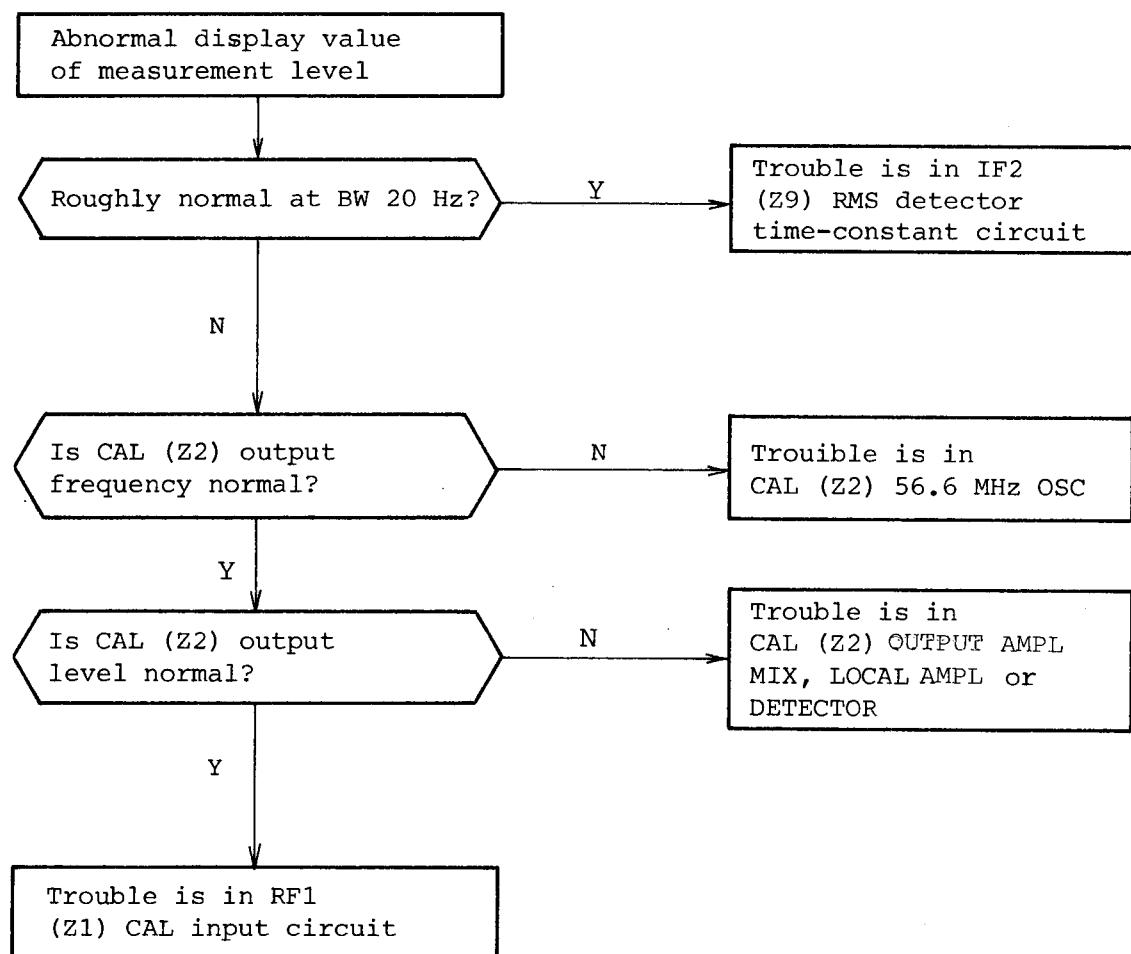

Fig. 4-2 (d) Troubleshooting Flowchart 4

Table 4-1 Correspondence between Malfunctions  
and Estimated Faulty Locations

Malfunction	Estimated faulty location	Schematic No.
1. Operation is impossible.	POWER SUPPLY (Z11) Power transformer, ac fuse CPU (Z10), FRONT PANEL (Z6)	29 25 to 28 22 to 24
2. No signals are received.	POWER SUPPLY (Z11) SELECTIVE mode: LOCAL (Z4) IF1 (Z8), IF2 (Z9) RF1 (Z1), RF2 (Z3) WIDEBAND mode: RF1 (Z1) IF2 (Z9)	29 17 to 20 6 to 16 2 to 4 2 to 3 10 to 16
3. Level indication is abnormal	POWER SUPPLY (Z11) CAL (Z2) RF1 (Z1) IF2 (Z9)	29 5 2 to 3 10 to 16
4. Control from the front panel is impossible.	POWER SUPPLY (Z11) CPU (Z10) FRONT PANEL (Z6)	29 25 to 28 22 to 24
5. Only IMPAIRMENT cannot be measured.	IF2 (Z9) CPU (Z10)	10 to 16 25 to 28
6. The demodulator does not operate.	IF2 (Z9) CPU (Z10)	10 to 16 25 to 28
7. Synchronization with the external reference frequency is impossible.	REFERENCE OSC (Z5) POWER SUPPLY (Z11)	21 29
8. The reception frequency is largely shifted	REFERENCE OSC (Z5) LOCAL (Z4), IF1 (Z8)	21 17 to 20 6 to 9
9. GPIB control is impossible.	CPU (Z10) POWER SUPPLY (Z11)	25 to 28 29

#### 4.3 Level Diagram

Figure 4-3 shows the level diagram of the ML422B/C. In this diagram, the vertical axis indicates the reference level at each point, and the horizontal axis indicates analog signal blocks from the signal input terminals to the DC output. By checking the reference level at each point, the gain and loss at each point can be determined for analog circuit troubleshooting. For example, if the analog signal path is disconnected at a certain point, troubleshooting can be performed by isolating each part. If the sensitivity of the level detector (e.g., oscilloscope) is too low to detect the level, the test can be performed by inputting a signal which is 20 dB higher in level than that shown in the level diagram.

#### Note:

The full scale setting of the ML422B/C has 2 modes, AUTO and MANUAL. The level diagram shown in Fig. 4-3 is applicable only when the full scale is set to the MANUAL mode.

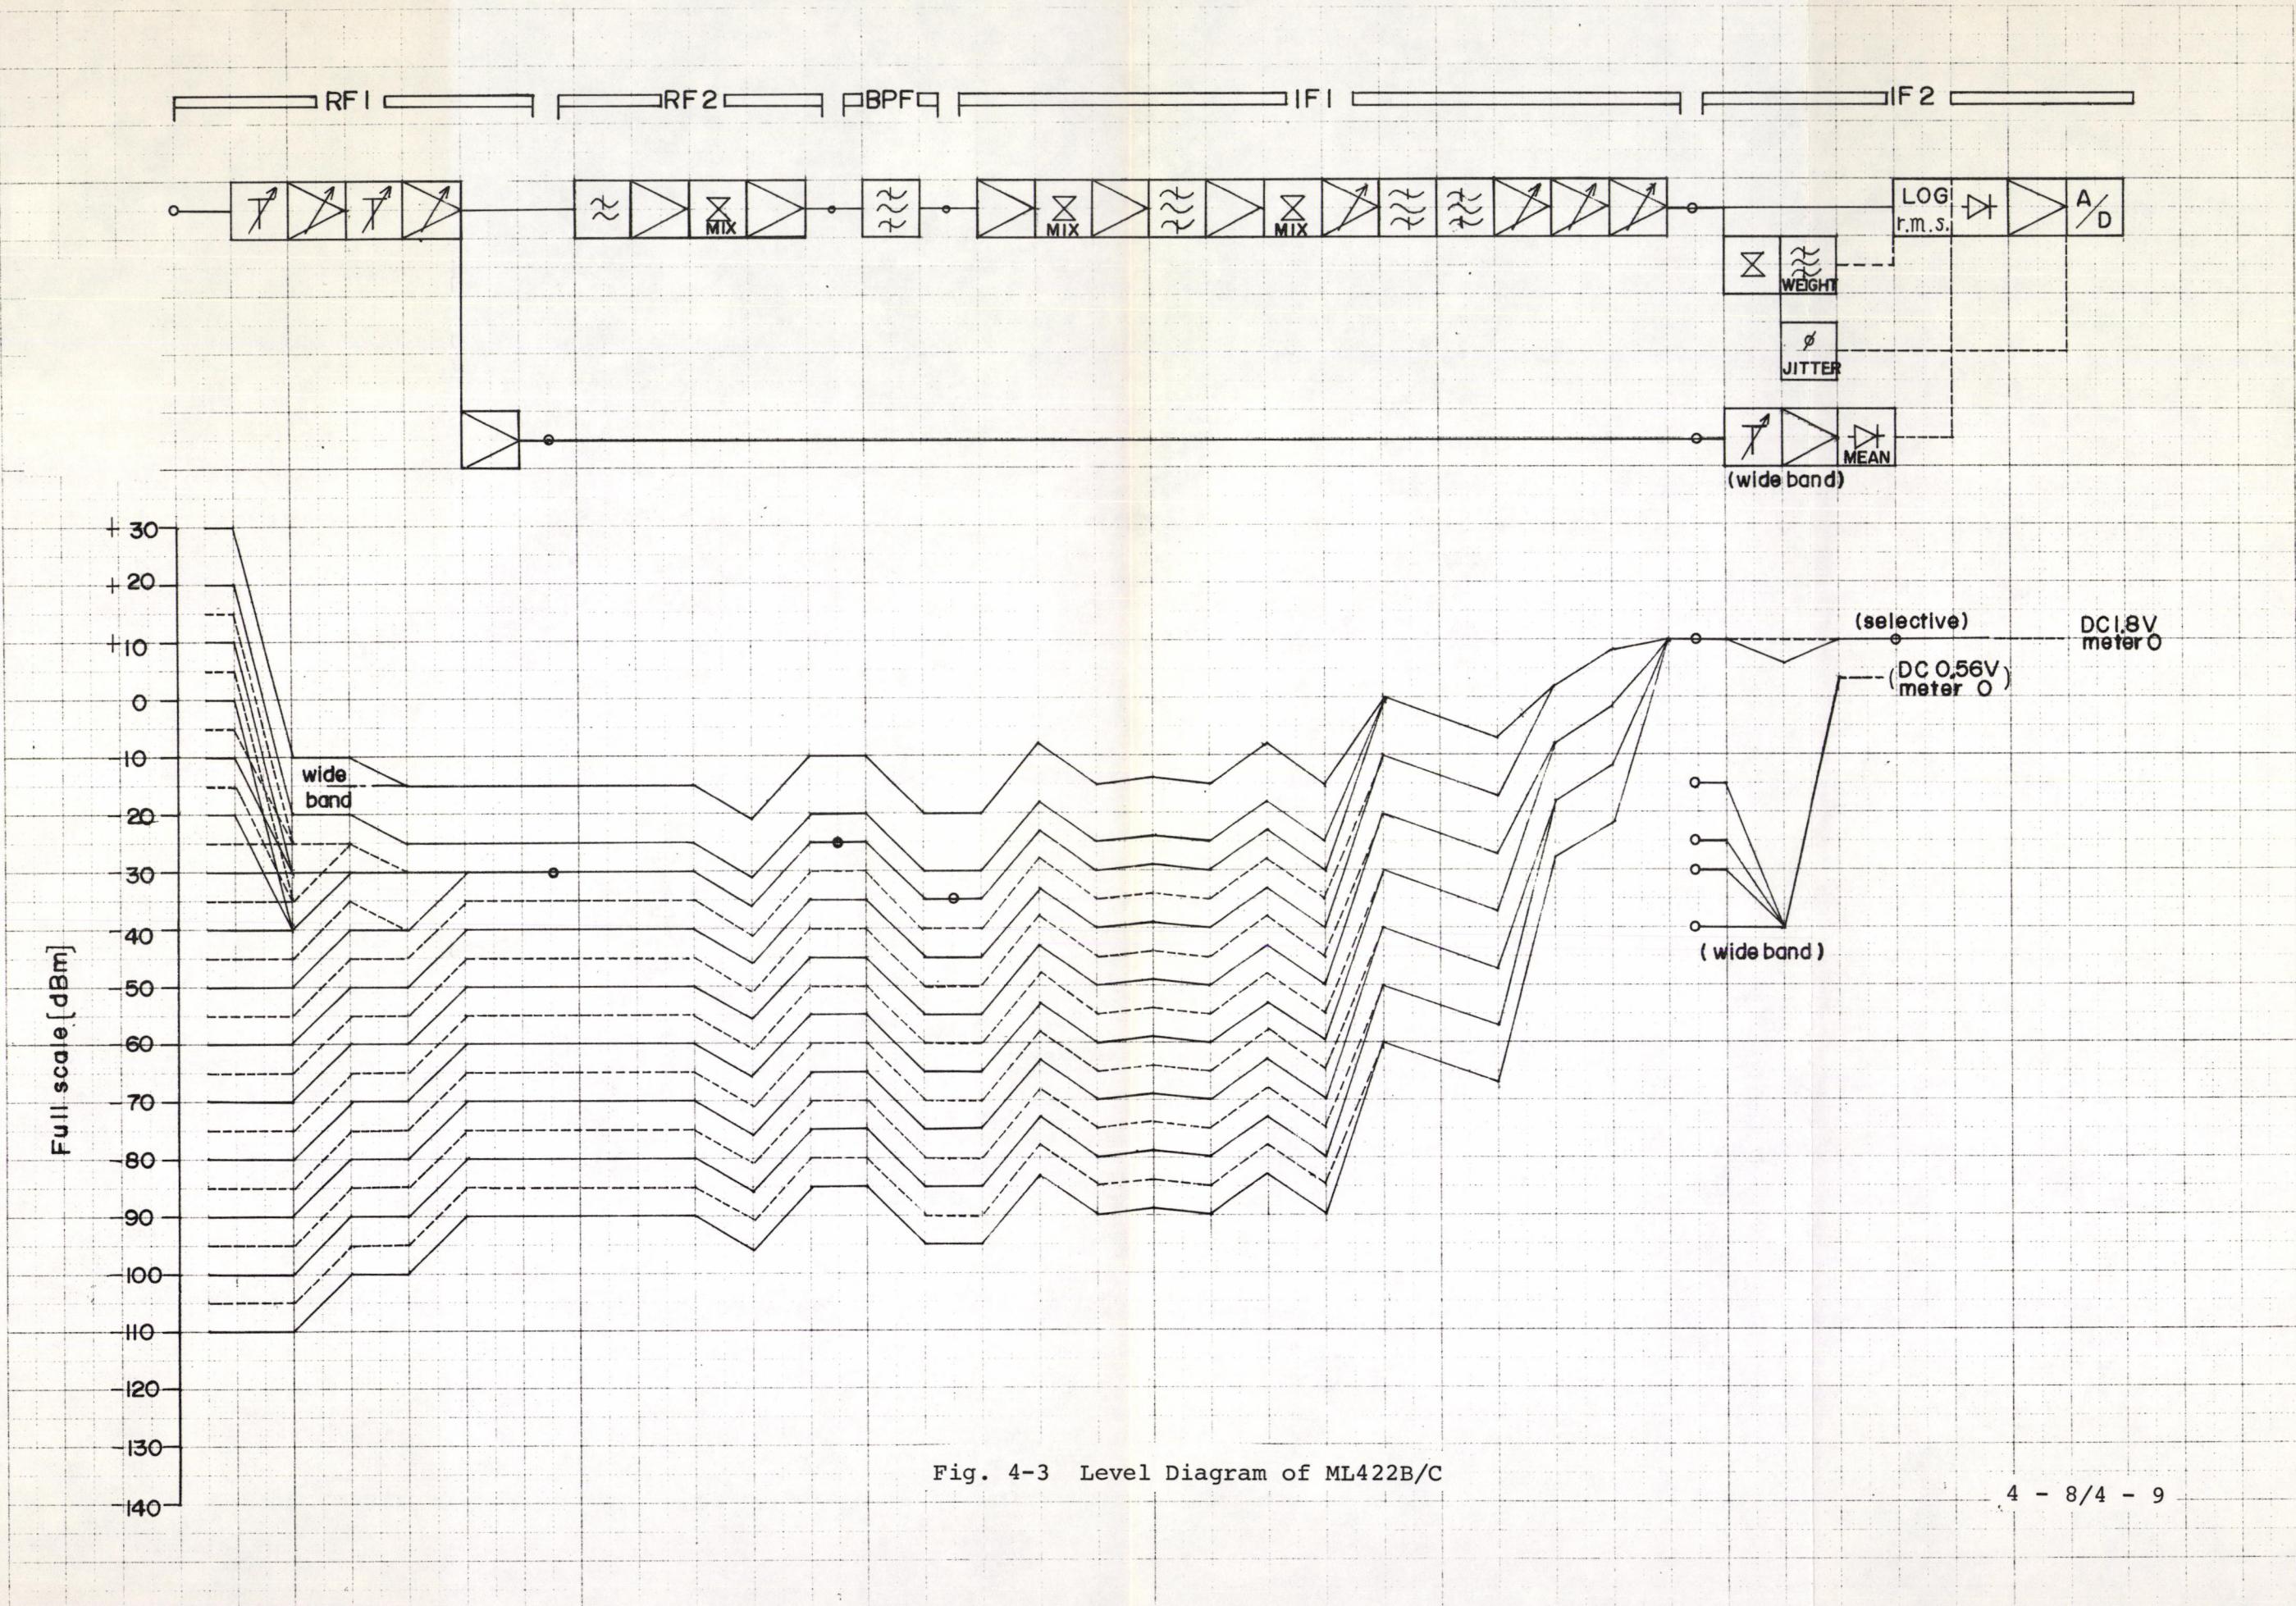

Fig. 4-3 Level Diagram of ML422B/C

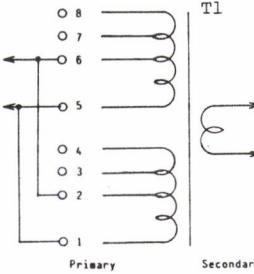

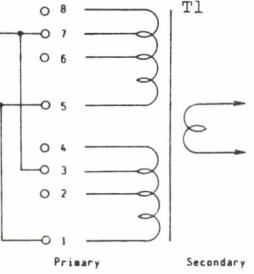

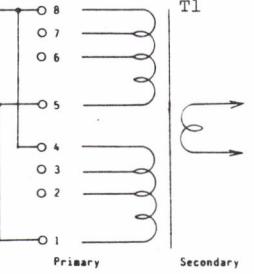

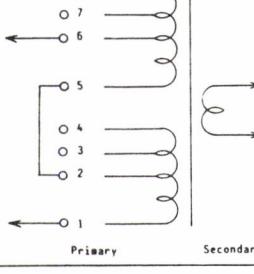

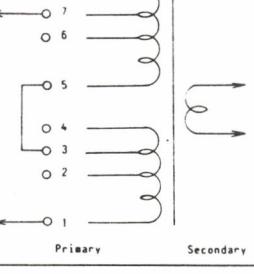

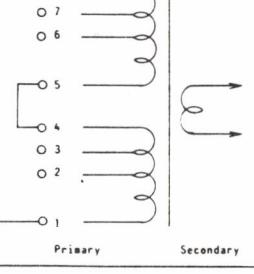

## 4.4 Circuit Descriptions

### 4.4.1 Power Supply Circuit (SCHEMATICS 1 and 29 )

Figure 4-4 shows the POWER SUPPLY circuit block diagram. This circuit consists of two sections. One is the power transformer section in which ac line voltage is converted to required voltage. An ac line voltage from 100 to 127 V or from 200 to 254 V can be used, by changing the wiring on the primary side of the power transformer. Refer to the following table for wiring.

The other is the dc regulator section supplying the four different dc voltages required for each circuit: +5 Vdc, +12 Vdc, +15 Vdc and -18 Vdc.

### Wiring for Power Supply Changing

Nominal ac Line Voltage	100 - 108V	108 - 117V	117 - 127V
100V System			
Nominal ac Line Voltage	200 - 216V	216 - 234V	234 - 254V
200V System			

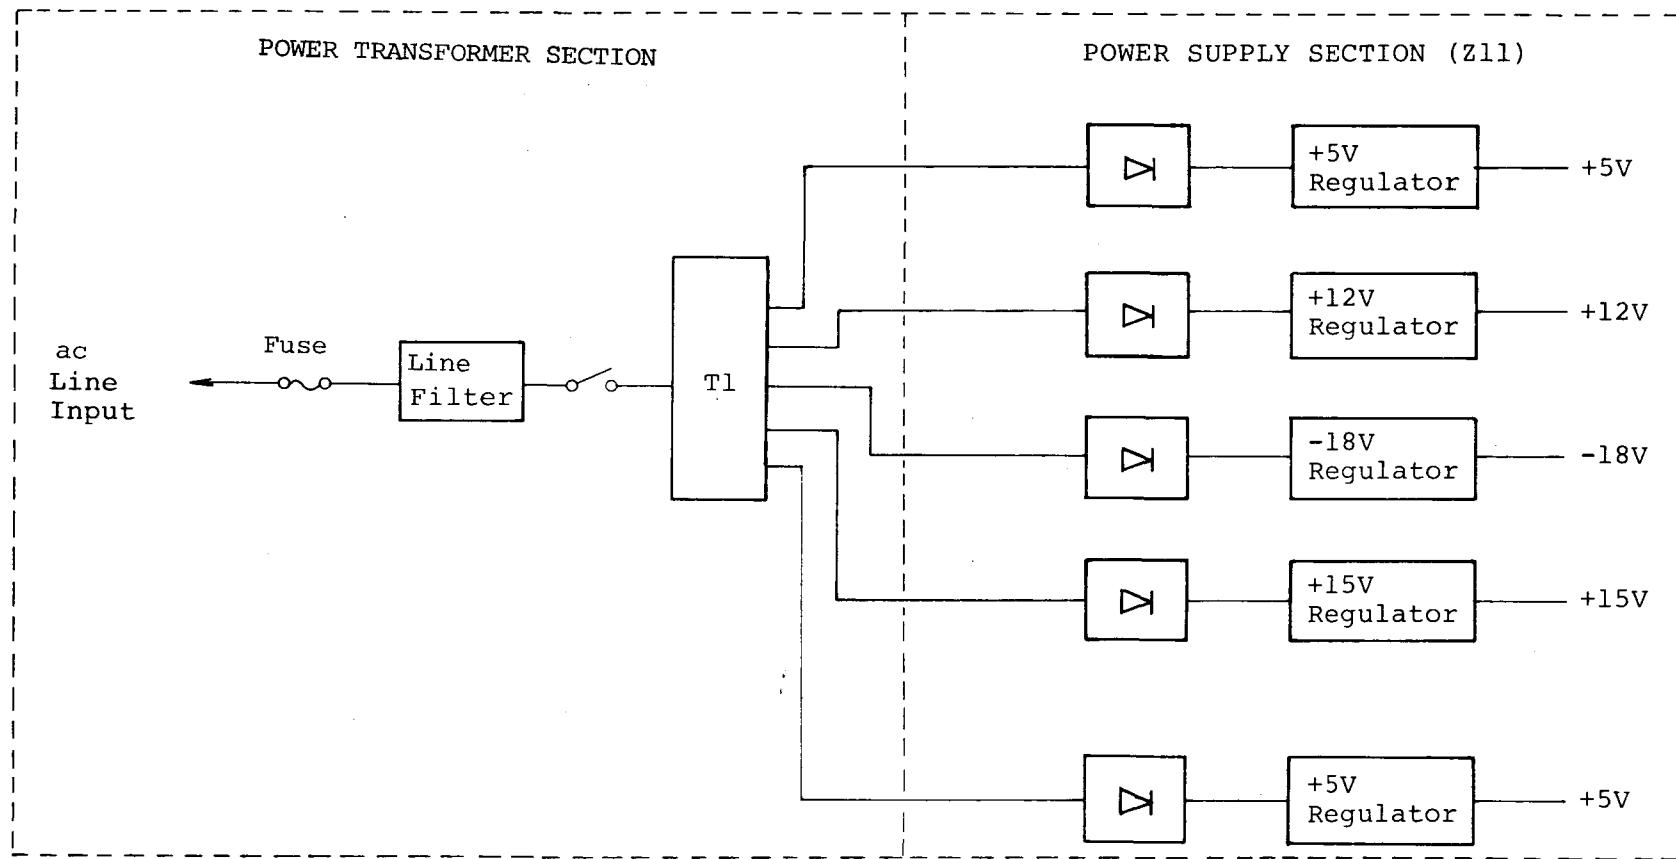

Fig. 4-4 Power Supply Circuit Block Diagram

4.4.2 RF Section (Z1, Z3)  
(SCHEMATICS      2      3      and      4      )

Figure 4-5 is the RF section block diagram.

The RF section consists of two blocks. The RF1 block controls the signal to be measured (without frequency conversion) according to ATT control information sent from the CPU. The RF2 block heterodynes the signal under measurement to produce the first IF signal (56.6 MHz).

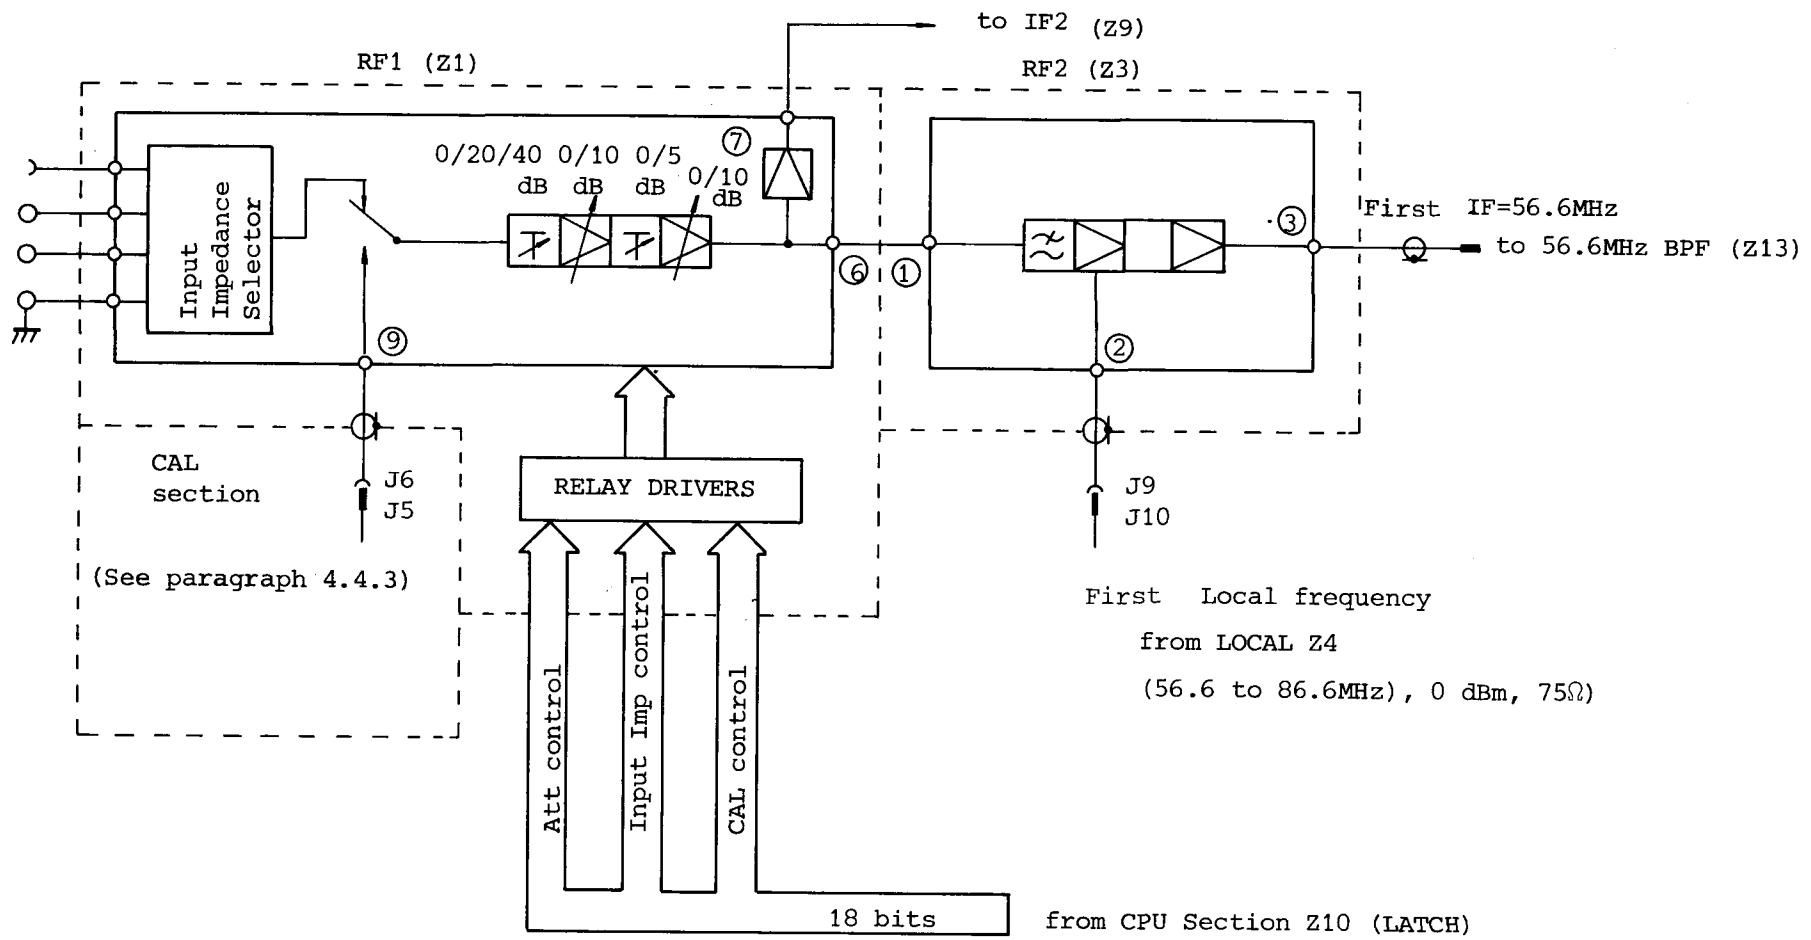

Fig. 4-5 RF Section Block Diagram

(1) RF1 (Z1) (SCHEMATICS **2** and **3**)

RF1 consists of an input impedance switch circuit, RF attenuators, and variable-gain amplifiers. These circuits can all be switched by the static signals which are generated by the CPU (Z10) and IF1 (Z8). The switch signals for the BALANCED circuit switching relays K8, K10 and K12 and for the CALIBRATION circuit switching relays K16, K17, K13 and K14 are latched with the Q47 (TC40H347P) of IF1 (SCHEMATIC **9**). The switching signals for other relays are latched by Q2 and Q3 (TC40H347P) of the CPU (SCHEMATIC **26**).

#### ATTENUATORS

A 0/20/40 dB high-impedance attenuator and 0/5 dB attenuator are installed. Each of these attenuators is of the resistor/capacitor split type.

#### AMPLIFIERS

At the first stage (Q32, Q1, Q2, Q3, and Q4), the FET-input high-impedance amplifier is installed. The gain can be switched (0/10 dB) by switching the Q2 emitter resistance between the stages by using the Q4 switch. At the next stage (Q33, Q5, Q6, Q7, and Q8), roughly the same amplifier as that installed at the first stage is installed.

The buffer amplifiers (Q9 and Q10) for WIDEBAND mode measurement are negative-feedback amplifiers with high input impedance and low output impedance.

The POWER SUPPLY (Z11) stabilizes the power supply voltage and then supplies to these amplifiers. When troubleshooting, check whether or not these power supply circuits are normal.

(2) RF2 (Z3) (SCHEMATIC 4 )

RF2 consists of a 35 MHz Low Pass Filter (LPF), a buffer amplifier, a first mixer, and a first amplifier.

35 MHz LPF

Used to remove an image signal. The cut off frequency is approx. 35 MHz. A 86 MHz to 116 MHz signal can be removed by 80 dB or more.

BUFFER AMPLIFIER

This is a negative-feedback amplifier with high input impedance and low output impedance. This amplifier consists of Q1, Q2 and Q4. Q3 is used to prevent crosstalk. The gain is approximately equal to  $(R8 + R9)/R9$ .

MIXER

This is a double-balanced ring modulator which converts a 50 Hz to 30 MHz signal into a 56.6 MHz first IF frequency signal by using the 56.6 to 86.6 MHz first local signal. The conversion loss is approx. 6 dB.

FIRST IF AMPLIFIER

This is a negative-feedback amplifier with high input impedance and low output impedance. This amplifier consists of Q5, Q6 and Q7 (T1 is used to match MIXER OUT to improve the S/N ratio). The gain is approximately equal to  $(R24 + R29)/R24$ .

#### 4.4.3 CAL Section (Z2) (SCHEMATIC 5 )

- (1) Supplying constant level signals at all frequencies

Figure 4-6 shows a section of the calibration signal generator circuit which supplies a constant level signal at all frequencies.

The 56.6 MHz crystal output signal is stabilized with the SAMPLE HOLD signal output by the 100 kHz reference signal.

The 56.6 MHz signal then goes to the next stage, where it enters the Automatic Level Control (ALC) circuit.

In the ALC circuit, the final amplifier output is fed to detectors Q25, Q27 and Q28 to obtain dc voltage  $V_{sig}$  as shown in Fig. 4-6.

$V_{sig}$  is compared with reference voltage  $V_{REF}$  set by adjusting R95.

(R95 should be adjusted after repair of this circuit to maintain accuracy).

The difference between  $V_{sig}$  and  $V_{REF}$  is then amplified by the dc amplifier Q29 and sent to variable amplifier Q11. The gain of amplifier Q11 is inversely proportional to the difference of the above voltage values. When  $V_{sig}$  equals  $V_{REF}$ , the output level of the ALC loop amplifier is constant.

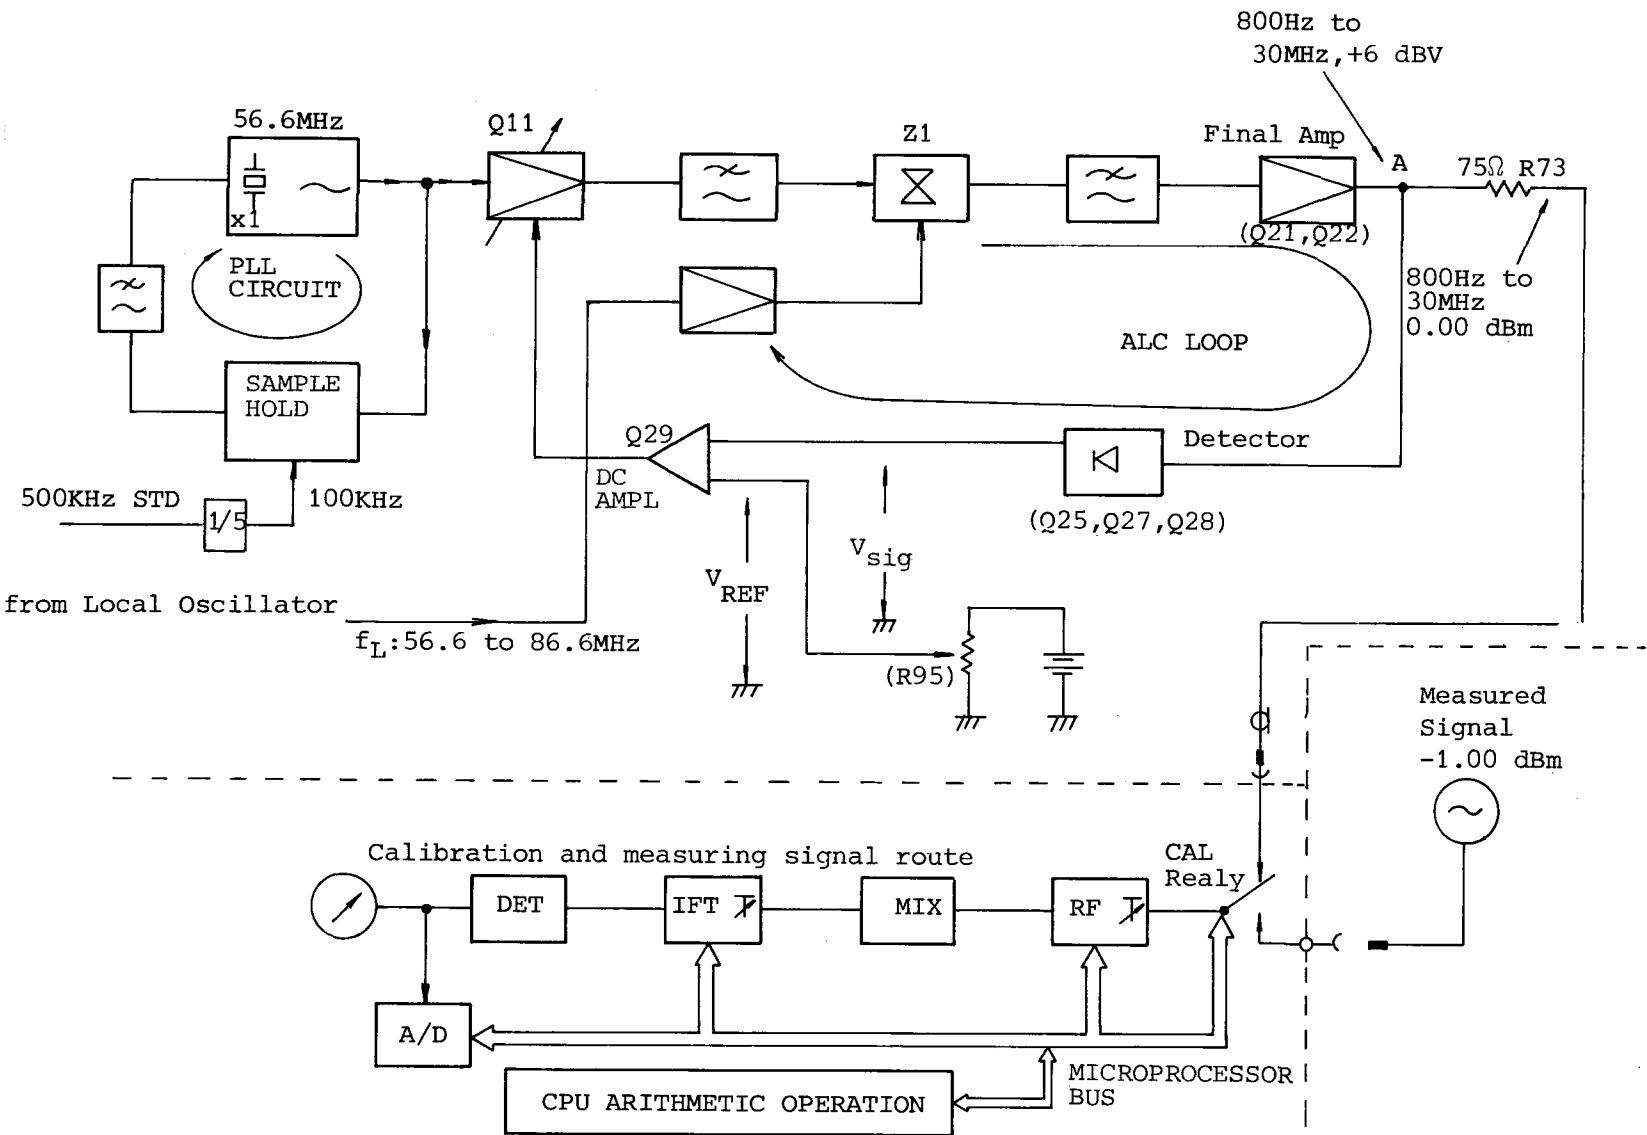

Fig. 4-6 Level Calibration Signal Generator Section

At the same time the 56.6 to 86.6 MHz first local frequency from the LOCAL section is mixed with the fixed 56.6 MHz in mixer Z1 to supply a signal with the same frequency as the measuring frequency. Since the calibration level is adjusted to 0.00 dBm by setting R95, the ALC amplifier always provides an accurately calibrated 0.00 dBm signal at all frequencies.

(2) Automatic level calibration

The programs stored in the Erasable Programmable Read Only Memory (EPROM) and Random Access Memory (RAM) execute automatic level calibration as follows:

- 1) Each time the operator performs a panel operation such as changing the bandwidth or measuring frequency, the CAL relay is connected to the calibration generator which supplies a calibrated 0.00 dBm signal.
- 2) If no operation is performed, the CAL relay is switched ON at 3 to 4 minutes interval.
- 3) When the UNCAL lamp does not light up, the MEASUREMENT display then displays the calibrated value (measured value - CAL value).

When the UNCAL lamp lights up, the MEASUREMENT display displays the measured value as it is. Figure 4-7 shows an example when a -1 dB signal is measured in CAL mode (CAL value = -0.5 dB relative to 0.00 dBm/75 Ω).

- 4) If a frequency response error is 0.5 dB, when the 0.00 dBm calibration signal is applied to the circuit, the CPU writes an error of -0.5 dB into the RAM.
- 5) If the UNCAL lamp lights up, the -1.00 dBm signal level is supplied with the -0.5 dB frequency response error. Therefore, the measured value indicates -1.50 dBm.
- 6) If the UNCAL lamp does not light up, the CPU calculates the measured result as:  
$$\begin{aligned}(\text{Measured value} - \text{CAL value}) &= -1.50 - (-0.5) \\&= -1.00 \text{ dBm.}\end{aligned}$$

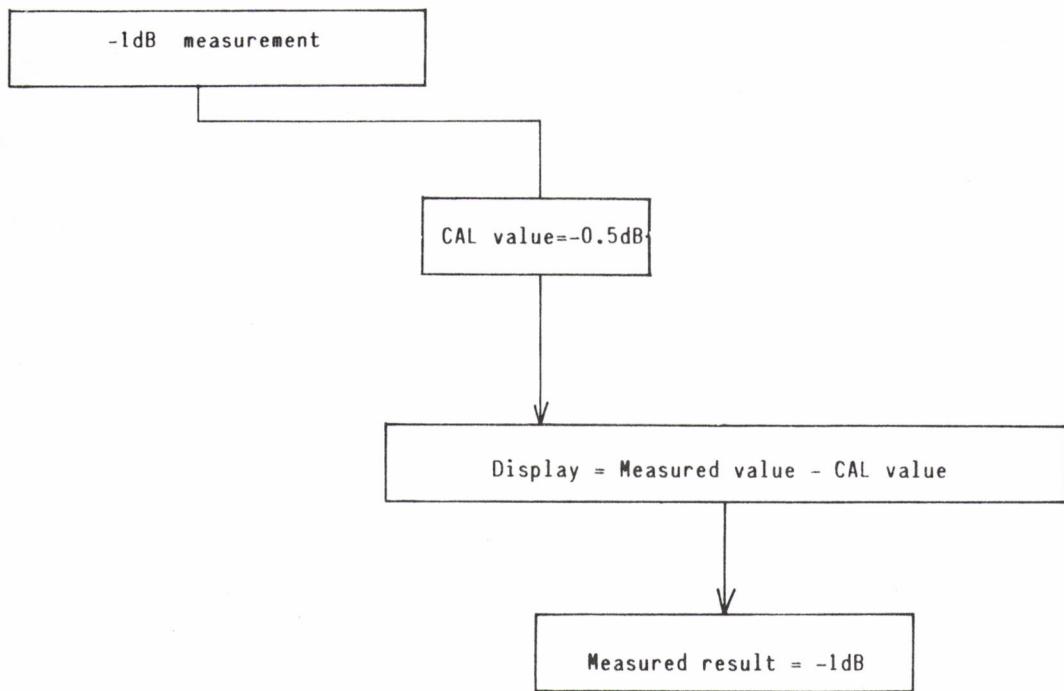

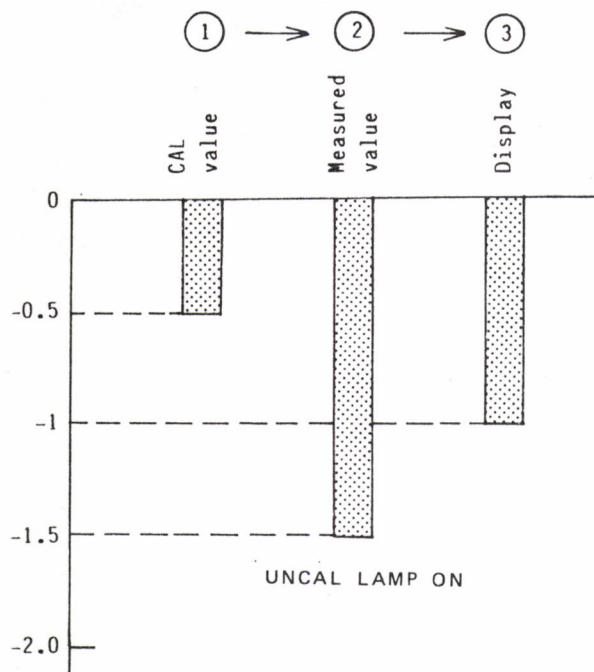

Fig. 4-7 Level Calibration Chart

#### 4.4.4 IF1 Section (Z8) (SCHEMATIC 6 , 7 , 8 and 9 )

Figure 4-8 shows the block diagram of IF1.

IF1 consists of the following circuits:

- Second mixer and second local which convert the first IF frequency (56.6 MHz) into the second IF frequency (600 kHz).
- Band Pass Filter (BPF) which determines a pass band width in SELECTIVE mode measurement.
- Third mixer which converts the second IF frequency into the third IF frequency (40 kHz for 48 kHz BW or 25 kHz for other BW).
- Counter which counts the IF frequency.
- Address recorder and latch for connection to the CPU.

##### First IF AMPL 2

This is a base-feedback-type amplifier, consisting of Q1 and Q2. Its gain is determined from the 56.6 MHz first BPF output impedance and the R1/R9 ratio.

This amplifier prevents internal spurious noise which is generated by inputting the second local signal to the RF stage.

##### Second mixer

This is a double-balanced ring modulator which converts a 56.6 MHz signal into a 600 kHz signal.

##### Second local buffer

This is a buffer amplifier which prevents signal leakage into the second local circuits, and amplifies a 56 MHz local signal up to the mixer operation level.

### Second AMPL 1

This is a buffer amplifier for impedance matching of the second mixer with the 48 kHz BPF.

### 48 kHz BPF

This BPF has the Chebyshev characteristics with center frequency 600 kHz and 3 dB bandwidth 48 kHz. The impedance is 1 k $\Omega$ .

### Second IF AMPL 2

This is a negative-feedback amplifier with input impedance 1 k $\Omega$  and low output impedance. This amplifier consists of Q7 and Q8. The gain is approximately equal to  $(R35 + R36)/R35$ .

### Third mixer

This is a double-balanced ring modulator which converts a 600 kHz signal into a 40 kHz or 25 kHz signal.

### Third local buffer

This is a buffer amplifier which prevents signal leakage into the third local circuit and amplifiers a 560 kHz or 625 kHz local signal up to the mixer operation level.

### STEP AMPL 1

This is a step amplifier consisting of the MA332 operational amplifier. The reference gain is +15 dB. The gain can be switched to +10 dB (R56) or 0 dB (R54).

### 20 Hz BPF

This is a 3-stage BPF containing a crystal filter of the matched pair type. The center frequency is 25 kHz, and the 3 dB bandwidth is 16 Hz.

### 3.1 kHz BPF

This BPF has the Chebyshev characteristics with center frequency 25 kHz and 3 dB bandwidth 3.1 kHz. The impedance is 1 kΩ.

### STEP AMPL 2

This is a step amplifier consisting of the MA332 operational amplifier. The reference gain is +5 dB. The gain can be switched to +15 dB (R73), +25 dB (R74), or +35 dB (R75).

### BW LOSS COMPENSATION

This circuit compensates the BW 20 Hz gain (R79), the BW 3.1 kHz gain (R78), the BW 48 kHz gain (R81), the BW 3.1 kHz 3 dB bandwidth (L33, R119, L34 and R120), and BW 48 kHz center flatness (L35).

### STEP AMPL 3

This is a step amplifier consisting of the MA332 operational amplifier. The reference gain is +5 dBm. The gain can be switched to +15 dB (R116), +25 dB (R117) or +35 dB (R118).

### Second local 56 MHz PLL

This PLL consists of Q49 through Q52 and Q54 through Q60.

The 56 MHz signal generated by the Voltage Control crystal Oscillator (VCXO) (consisting of X1, Q50 and Q51) is synchronized using a 1 MHz signal which is generated by dividing the internal reference signal. The diode bridge (Q56 through Q59) is used as the phase detector. A sampling pulse is generated by Q60 (75SO2).

### Limiter

This limiter amplifier consists of the operational amplifier. Its gain is 100 dB higher.

### X10 multiplier

This is a X10 multiplying circuit consisting of PLL. This circuit is used to shorten the gate time for frequency readout.

### Counter

This consists of  $\mu$ PD8253C-5 (16-bit counter X3), which is IC for a timer. Also the gate time is internally generated.

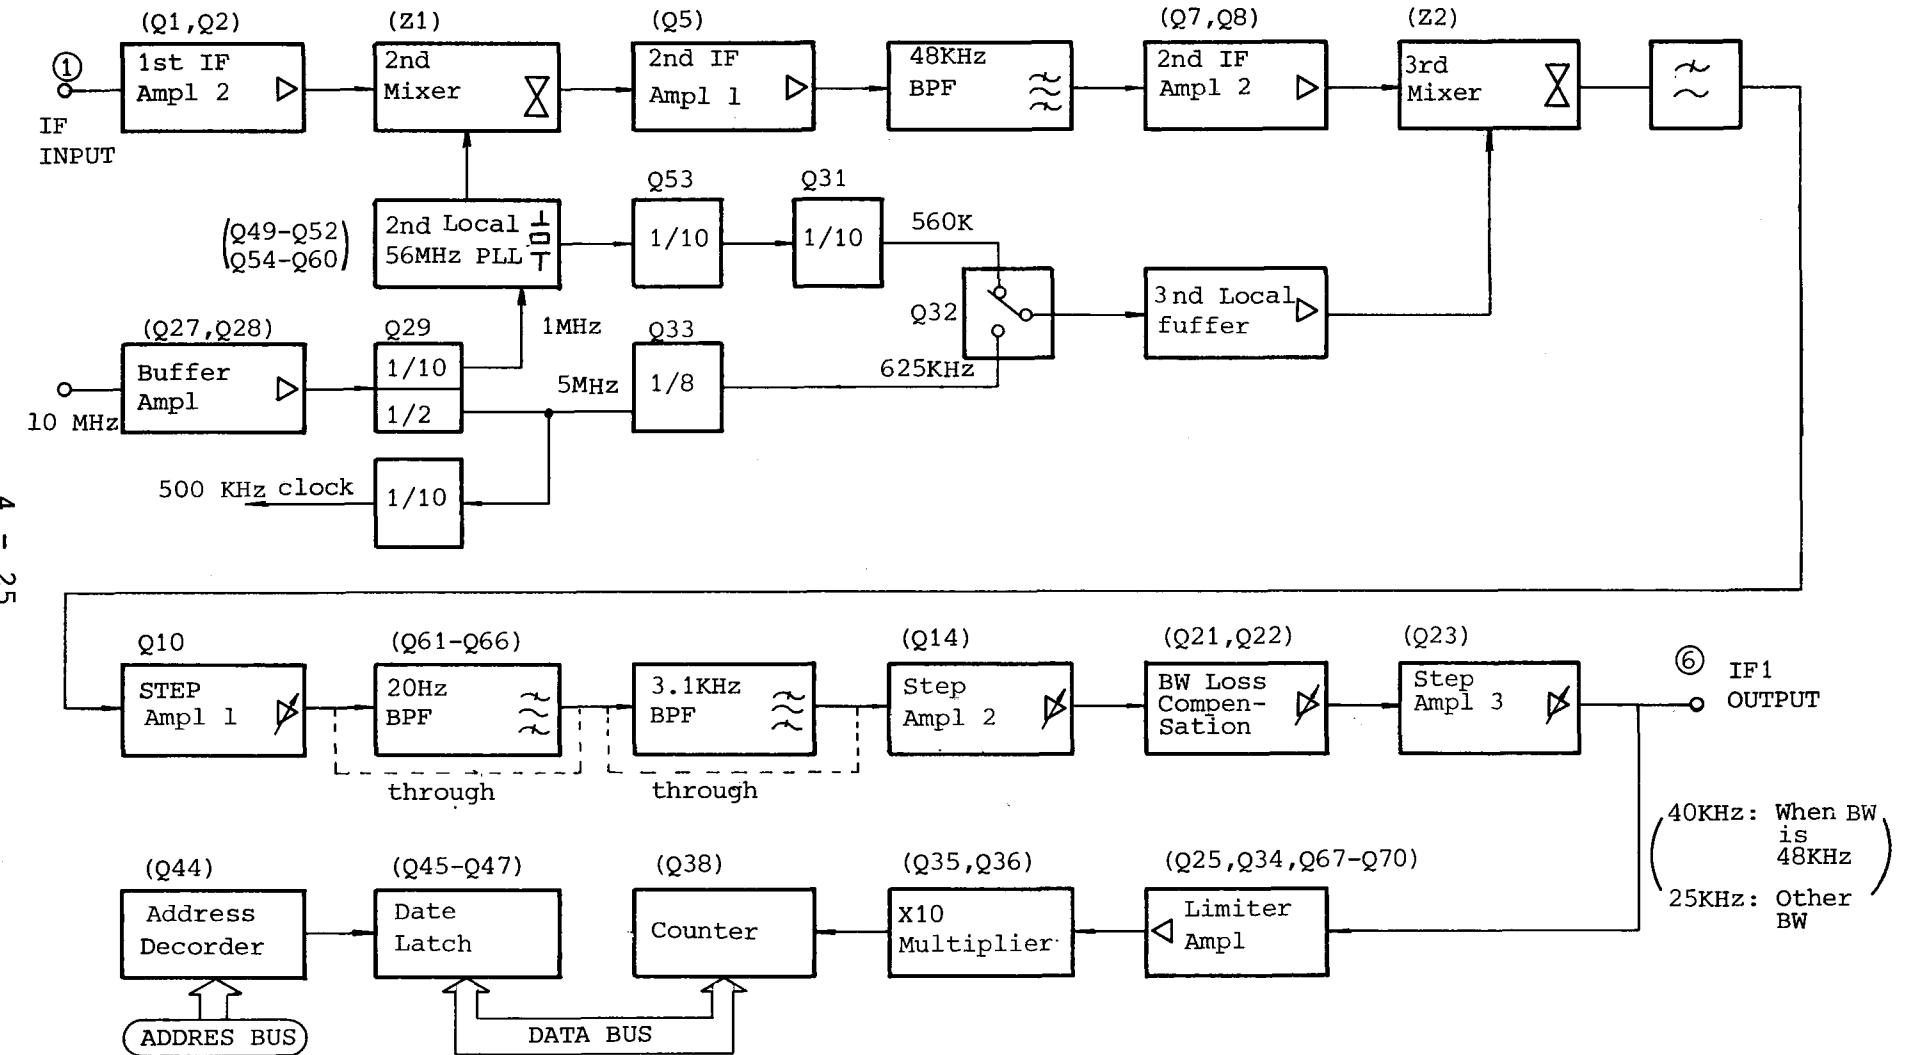

Fig. 4-8 IF 1 Block Diagram

#### 4.4.5 IF2 Section (Z9) (SCHEMATIC 10 to 16 )

Figure 4-9 shows the block diagram of IF2. IF2 consists of a wideband detector, a demodulator, an impairment measuring circuit, an rms detector, a high-speed/peak detector, and an A/D converter.

##### Wideband amplifier and detector

The wideband amplifier consists of Q1 through Q3, and the wideband detector consists of Q5 through Q8.

A signal which is input to this amplifier is amplified by approx. 38 dB by Q1 (UA733CN), and then amplified by 6 dB by the negative-feedback circuit (Q2 and Q3). The amplified signal is converted into a dc signal by the wideband mean-value detector (Q5, Q6 and Q7). The diode non-linearity is compensated and the stability is improved since negative feedback is applied by the detector diodes Q6 and Q7 in the amplifier/detector circuit.

##### OVERLOAD comparator

This circuit compares the dc voltage (supplied from the wideband detector) with the reference voltage in order to check whether or not the power applied to the RF stage exceeds the reference value.

##### Demodulator

This circuit demodulates a Single Sideband (SSB) signal into the original voice-frequency signal. Since the SSB signal does not contain a carrier, a carrier must be added to demodulate the SSG signal. Since the BW for the channel of the ML422B/C is 3.1 kHz, a signal of which the frequency is  $\pm 1.85$  kHz distant from the IF center frequency (25 kHz) is applied to the product

detector (Q75) in order to demodulate the SSB signal into a 0.3 to 3.4 kHz voice-frequency signal.

#### Phase detector circuit

This circuit measures the quantity of phase jitter degree (p-p) contained in a 1 kHz tone signal.

The signal applied to this circuit is band-limited by the BW 600 Hz BPF, and then input to Q36 (CD4046 BCN) and is detected by the phase detector consisting of PLL.

A signal of which the frequency is higher than the detected signal by 20 Hz or more is picked up as a jitter component, and is band-limited by the 300 Hz LPF, then is sent to the peak detector (Q40, Q42 to Q45), and is converted into a dc signal. This dc signal is converted into a digital signal by the A/D converter (Q92), processed by the CPU, and then displayed at the MEASUREMENT display.

#### Weighting and notch filters

This is an active filter consisting of an operational amplifier, resistor and capacitor.

In the ML422B, the weighting filter is used for the C message defined in the Bell system. In the ML422C, the weighting filter is used for psophometric weighting defined in CCITT Rec. P.53. The notch filter removes the 1010 Hz ±15 Hz signal (which is used to measure a signal-to-noise ratio) by approx. 60 dB.

#### RMS detector and log circuit

The Q73 (AD536) is used as the rms detector. This IC can perform a square average. Log output is supplied from the log converted contained in it.

### High-speed detector

This is a peak detector consisting of Q79, Q80 and Q81. This circuit is used to detect impulse noises. In the hot tone search mode, this detector is used as a mean-value detector since a video filter is inserted after detection.

### Threshold level generator

This circuit generates a threshold voltage at IMPULSE NOISE or TONE SEARCH mode. Using an 8-bit D/A converter (Q82) contained in this circuit, the attenuation level can be changed by 30 dB in 1 dB steps.

### A/D converter

This is an integral type A/D converter with 13-bit resolution. This circuit converts an alalog voltage (0 to 1.999 V) into a digital value. The conversion time is approx. 10 msec.

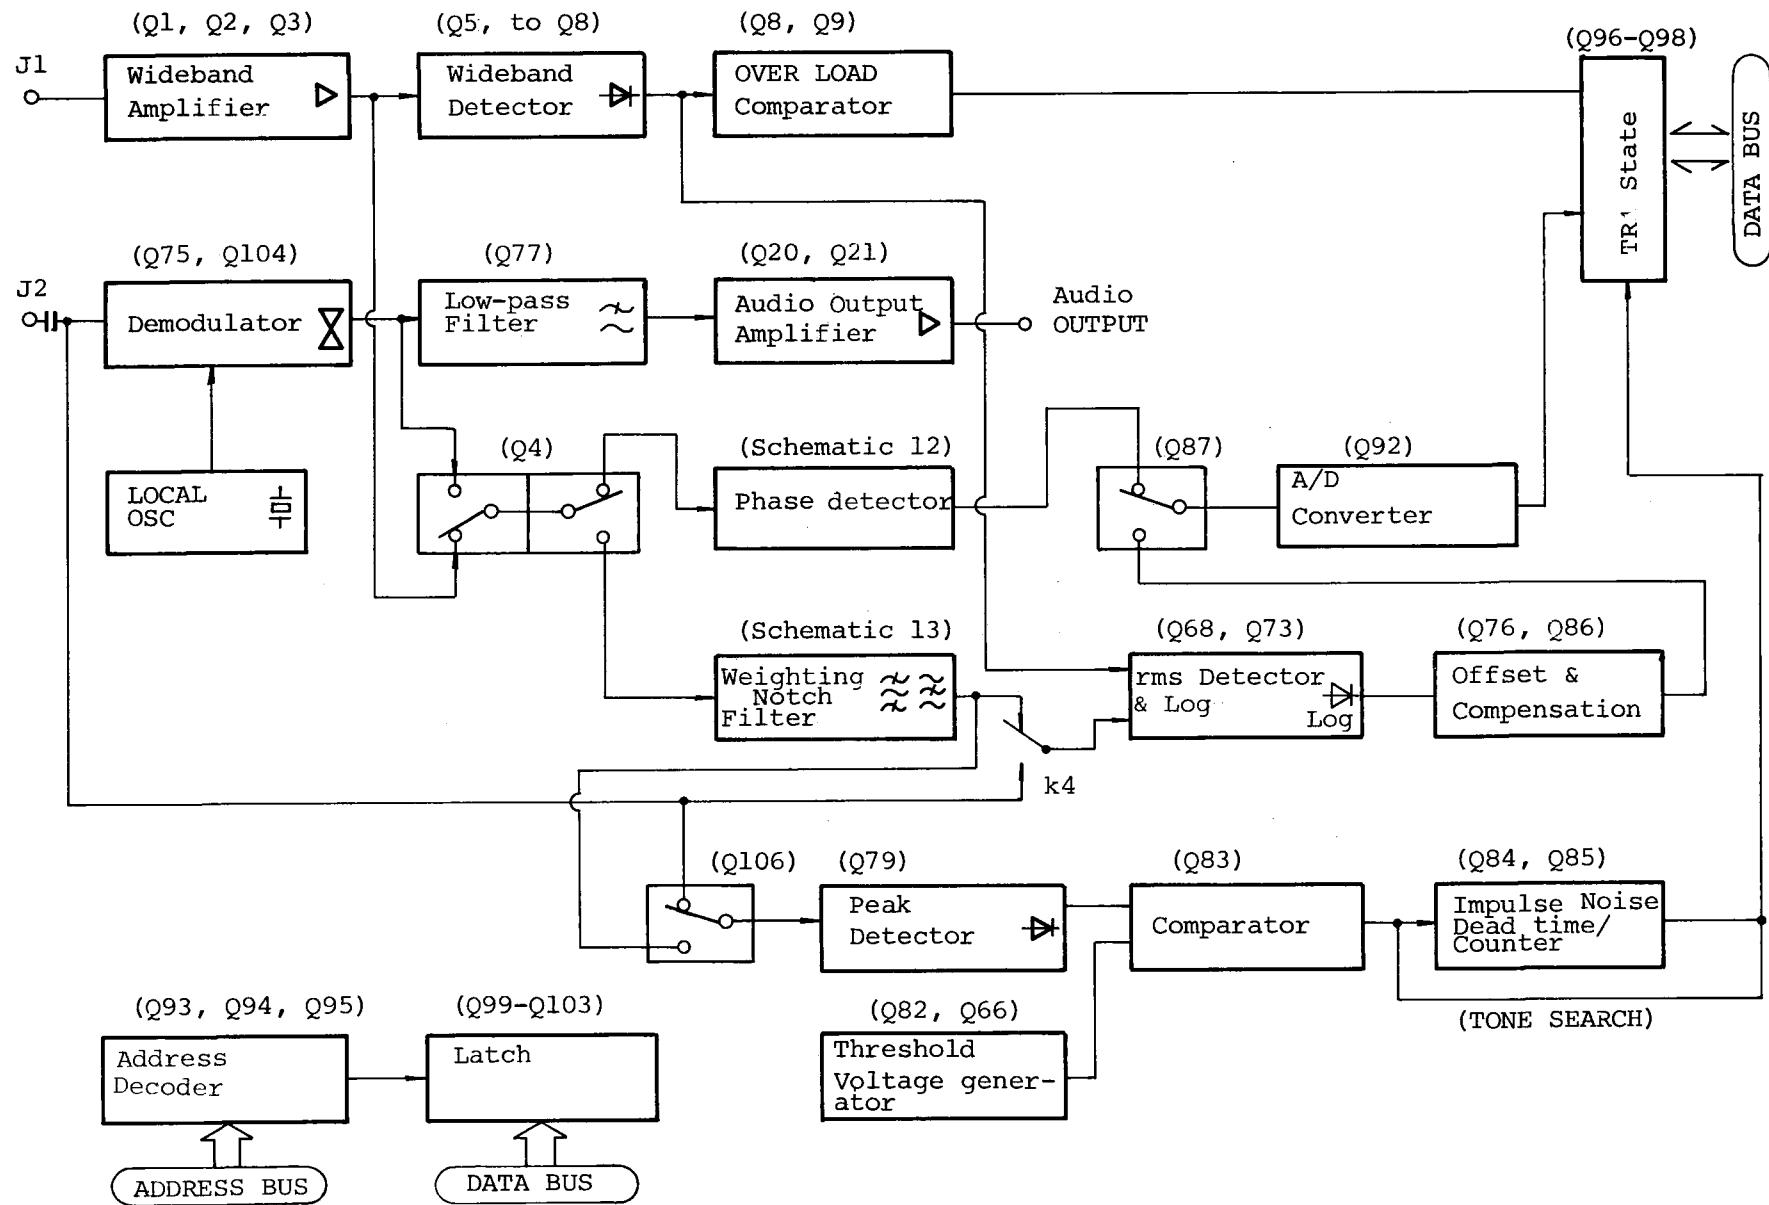

Fig. 4-9 IF2 Block Diagram

#### 4.4.6 LOCAL Section (Z4) (SCHEMATIC 17, 18, 19 and 20)

Figure 4-10 shows the block diagram of the LOCAL section. This section consists of three 1/N-type Phase Locked Loops (PLL) and one SUM loop. Each component has the following frequency range:

- PLL1 : 81.6 MHz to 82.4 MHz (80 Hz step)
- PLL2 : 75.8 MHz to 95.7 MHz (100 kHz step)
- PLL3 : 48 MHz to 78 MHz (2 MHz step)
- SUM loop: 56.6 MHz to 86.6 MHz (1 Hz step)

The frequency information sent from the CPU is latched by the Q4 and Q7 (TC40H374P). This frequency data is used as the N information for frequency setting, by PLL1, PLL2 and PLL3. Moreover, this digital data is converted into analog voltage by the D/A converter in PLL2, PLL3, and the sum loop, and is used as the preset voltage for various Voltage-Controlled Oscillators (VCO).

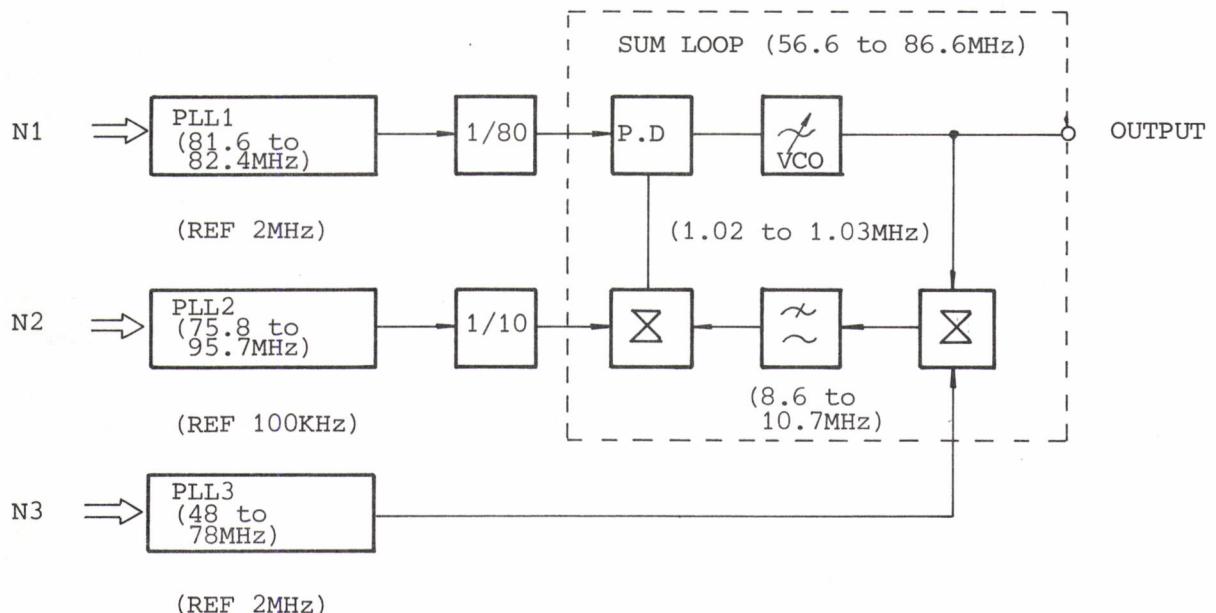

Fig. 4-10 LOCAL Section Block Diagram

### PLL1

This circuit processes the low-order 4 digits of an 8-digit local frequency. The frequency setting information is represented in BCD, and the high-order 2 digits are latched by Q6, with the low-order 2 digits are latched by Q7. This setting information is equal to the low-order 4 digits of the frequency indicated at the FREQUENCY display.

### PLL2

This circuit processes the middle-order 2 and 1/2 digits (1 kHz digit odd number, 100 kHz digit and 10 kHz digit) of an 8-digit local frequency. The frequency setting data is represented in binary notation, and is latched by Q5. This setting data has the following value:

(Binary value obtained by converting the 10 kHz and 100 kHz digits indicated at the FREQUENCY display)

plus 64 (hexadecimal)

The 64 (hexadecimal) is added only when the digit at the 1 MHz is an odd number.

### PLL3

This circuit processes the high-order 1 and 1/2 digits (10 MHz digit and 1 MHz digit even number) of an 8-digit local frequency. The frequency setting data is represented in binary notation, and is latched by Q4. This setting data has the following value:

(Binary value obtained by dividing the high-order 2 digits (10 MHz digit and 1 MHz digit) of the frequency indicated at the FREQUENCY display by 2, and by rounding down the decimal fractions (to obtain an integer), and by converting the result into a binary number)

plus 02 (hexadecimal)

SUM loop

This circuit sums up the PLL1, PLL2 and PLL3 frequencies, and provides a 56.6 to 86.6 MHz (1 Hz step) local signal.

#### 4.4.7 REFERENCE OSC Section (Z5) (SCHEMATIC 21 )

Figure 4-11 is the REFERENCE OSC Section block diagram. For INTERNAL operations, the  $Z_1$  Voltage control Oscillator (VCO) is adjusted by turning R53 until the oscillating frequency is 50 MHz.

For EXTERNAL operations, part of the  $Z_1$  VCO output is looped via the EXT-INT switch to the phase-locked loop circuit. The 50 MHz oscillator output can be used as an accurate signal source stabilized with the SAMPLE HOLD signal, which is controlled by an external reference crystal signal.

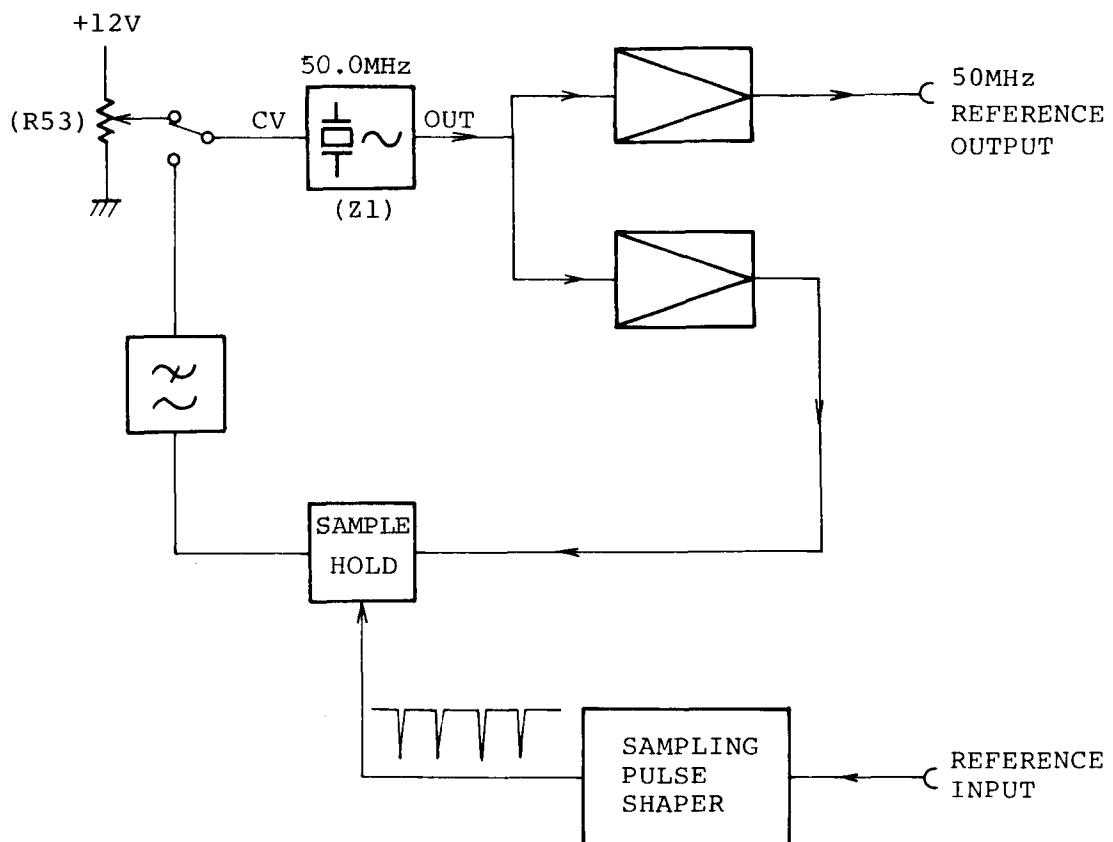

Fig. 4-11 REFERENCE OSC Section Block Diagram

#### 4.4.8 FRONT PANEL Section (Z6) (SCHEMATICS 22 , 23 and 24)

Figure 4-12 is the FRONT PANEL Section block diagram.

The front panel features all LED displays dynamically driven for low power dissipation and interrupt generation circuits for sending signals to the CPU by pushbutton operation and by interval timer.

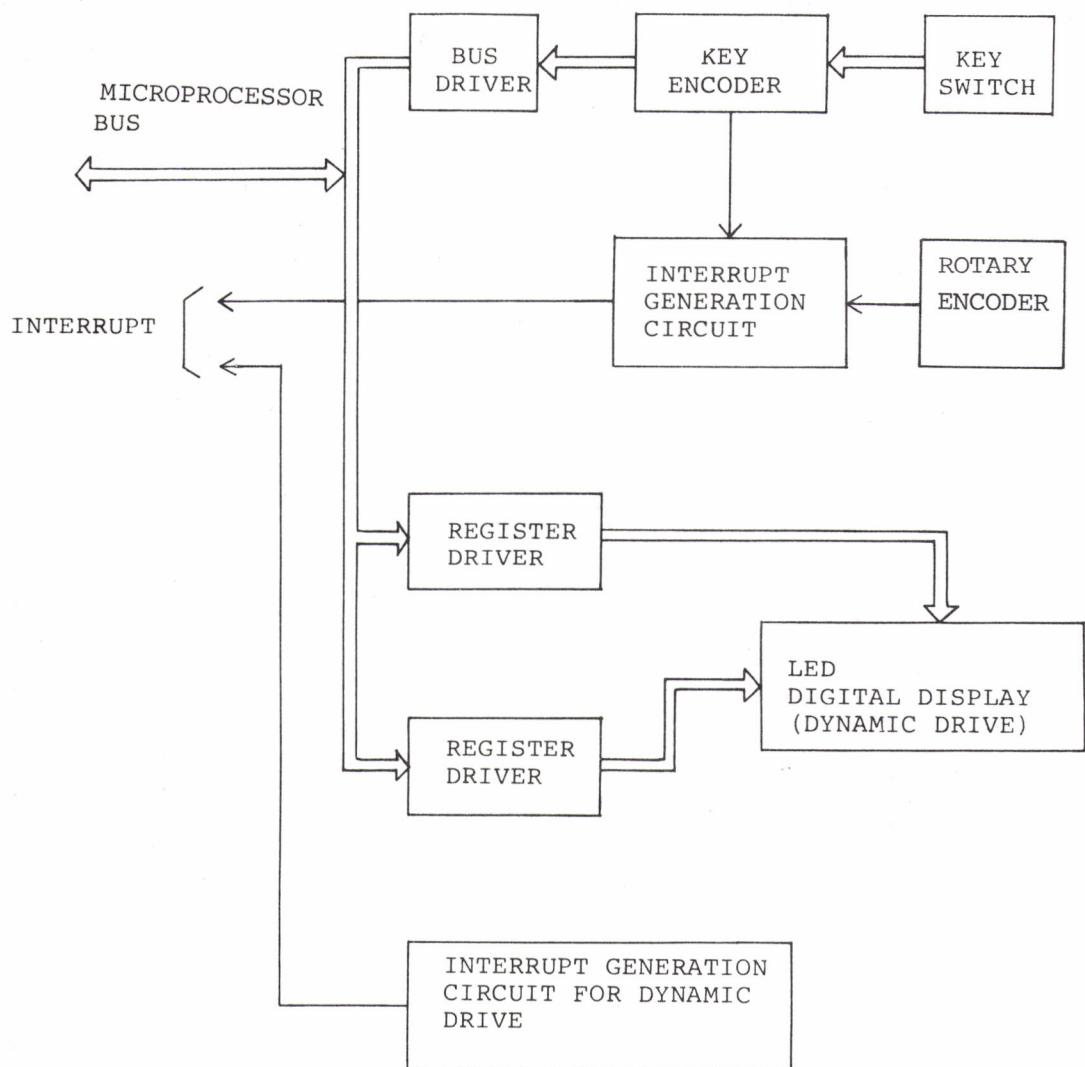

Fig. 4-12 FRONT PANEL Section Block Diagram

### Rotary encoder

A disk with slits cut around the edge is connected directly to the dial. When the dial is rotated, light projected from a light emitting diode (LED) passes through the slits and is detected by a phototransistor. Phototransistor outputs are shaped in the pulse shaping circuit. One of the outputs is used for the counter clock signal and interrupt timing. The other is used to set the counter UP or DOWN, depending on which way the dial is turned. Thus, FINE dial tuning data is sent to the LOCAL Section to fine tune the local frequency.

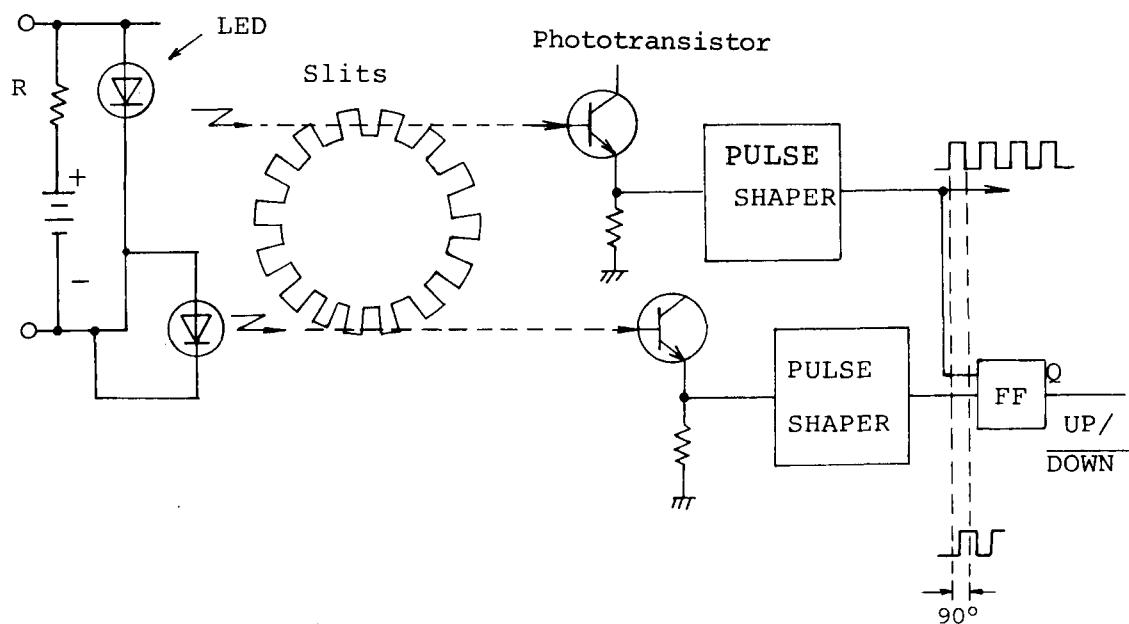

Fig. 4-13 Rotary Encoder

4.4.9 CPU Section (Z10) (SCHEMATICS 25 26 27 and 28 )

Figure 4-14 is the CPU Section block diagram. The CPU writes data into and reads data from Read Only Memory (ROM) and Random Access Memory (RAM). The CPU transmits data to or receives data from each section of ML422B/C. There are three busses:

- . Bidirectional data bus
- . Control bus
- . Address bus

The ML422B/C uses a battery for RAM data backup, so that RAM data is secured while ML422B/C power is off.

This battery is charged during power supply because of floating use.

8085 is used as the CPU. Since the address space of 8085 is very wide, it is divided as shown in Table 4-2.

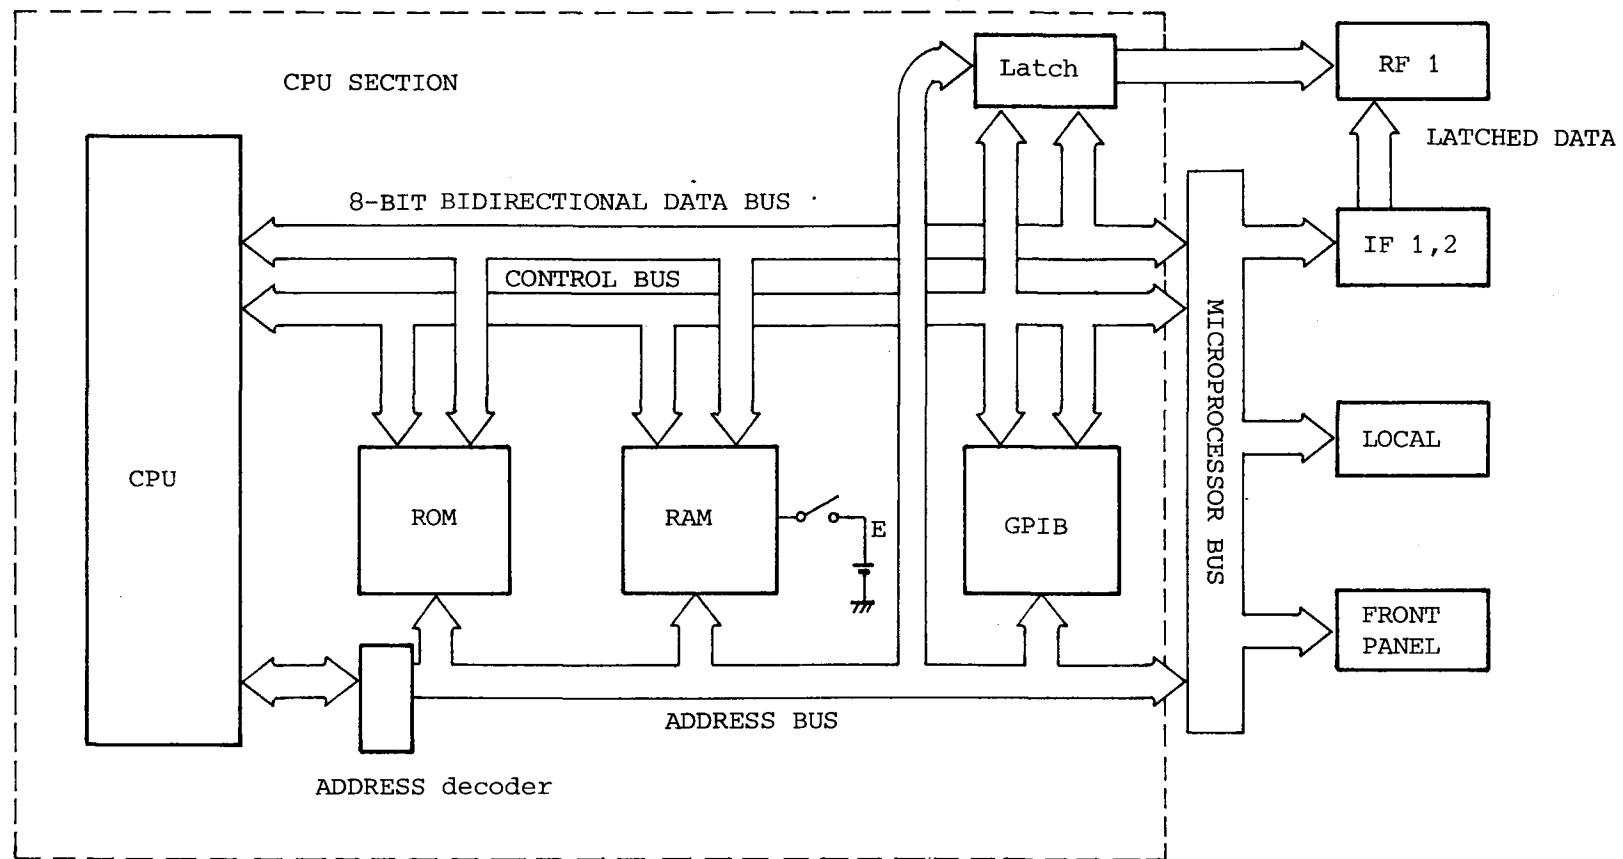

Fig. 4-14 CPU Section Block Diagram

Table 8-2 CPU Address Map

ADDRESS (hexadecimal)	Usage
0000 - 0FFF	ROM (Q18), INTERRUPT
1000 - 1FFF	ROM (Q19), MEASURE
2000 - 2FFF	ROM (Q20), GPIB
3000 - 37FF	RAM (Q21), WORK
3800 - 3FFF	Not use
4000 - 4FFF	ROM (Q22), OPTIONAL
5000 - 53FF	RAM (Q16, Q17), backed up Memory
5400 - 5FFF	Not use
6000 - 600F	I/O FRONT PANEL (Z6) and RF1 (Z1)
6010 - 6FFF	Not use
7000 - 700F	I/O, IF1 (Z8)
7010 - 7FFF	Not use
8000 - 800F	I/O, GPIB
8010 - 8FFF	Not use
9000 - 900F	I/O, IF2 (Z9)
9010 - 9FFF	Not use
A000 - AFFF	ROM (Q23), Subroutine
B000 - B003	TIMER (Q29)
B004 - FFFF	Not use

### CPU (Z10) troubleshooting

Since CPU board troubleshooting is very difficult, a faulty CPU board should be replaced when found. However, troubleshooting of the CPU board can be carried out, using the following equipment:

FLUKE 9010A MICRO-SYSTEM TROUBLESHOOTER  
8085 INTERFACE POD

### Procedure

- 1) Using the extender board, pull out the CPU board (Z10) from the ML422B/C cabinet.
- 2) Remove Q30 (uPD8085AC) from the socket.
- 3) Insert the 8085 INTERFACE POD adaptor into the socket for Q30.
- 4) Perform the bus test.

Check the CPU board (Z10) bus and the IC connected to the bus.

- 5) Perform the ROM test.

Check the ROM by comparing the signature data with the standard signature obtained from the normal CPU board in the LEARN mode.

- 6) Perform the RAM test.

Check the RAM in the RAM SHORT mode.

Note: The CPU address map is shown in Table 4-2.

## SECTION 5

### REPLACEABLE PARTS

#### 5.1 Introduction

This section contains information relative to ordering replacement components. The following table shows circuit references (hereinafter CKT REF) and abbreviations used for components given in the component list. In the component list, the quantity of each component is one so far as no quantitative description is given in the "NOTE" column.

## (1) Circuit References

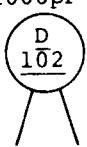

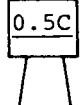

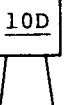

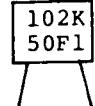

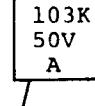

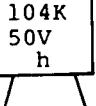

AT: Attenuator	K: Relay	Q: Transistor, Diode, Rectifier, IC	T: Transformer
C: Capacitor	L: Coil	R: Resistor	V: Neon lamp, Vacuumtube
F: Fuse	M: Meter, timer	S: Switch	Z: Unit
J: Jack, plug, connector	P: Lamp		

## (2) Abbreviations

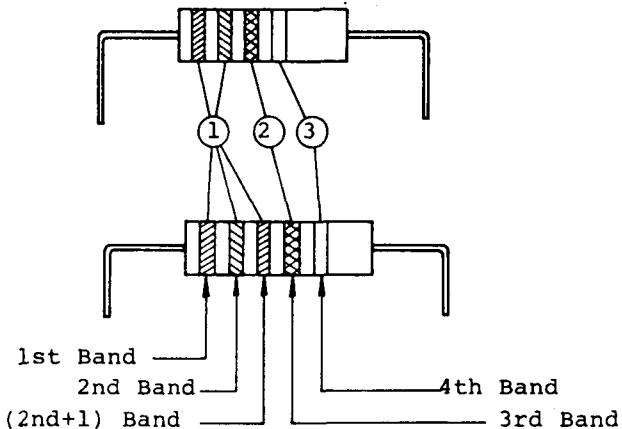

A : amperes	J-FET : junction FET	PNP : positive-negative-positive	
Att,R var: attenuator variable using film resistive elemetns	k : kilo ( $\times 10^3$ )	P-P,PP : peak to peak value	
BL : boundary layer	LED : light emitting diode	RFC : RF choke	
Cer : ceramic	M : mega ( $\times 10^6$ )	R-lamp : resistor lamp	
CF : carbon film	m : milli ( $\times 10^{-3}$ )	rms : effective value (root means square)	
Comp : composition	MF : metallized film	SBD : shottky barrier diode	
CRT : cathode-ray tube	MOS-FET : metal oxide semi-conductor FET	SCR : silicon controlled rectifier	
Di : diode	M paper : metallized paper	Si : silicon	
DIL type : dual-in line type	M plast : metallized plastic film	SRD : step recovery diode	
Elect : electrolyte aluminum	Multi : multiplying	Tant : tantalum	
F : farad	N ch : N channel	Tr : transistor	
FET : field effect transistor	non-lin : non-linear taper	Trans : transformer	
G : ground	Non-pol : non-polarity	TM : time-lag	
Ge : germanium	NPN : negative-positive-negative	.. : micro ( $\times 10^{-6}$ )	
H : henry	Ω : ohms	V : volt	
Hz : hertz	p : pico ( $\times 10^{-12}$ )	Var : variable	
IC : integrated circuit	Plast : plastic film	WW : wire wound	
IEC : applicable to IEC safety standard	PMTR : potentiometer	XTAL : crystal	

## 5.2 Method of Reading Capacitors/Resistors

### 5.2.1 Capacitor identification

### 5.3 Ordering Information

Upon ordering components, please give the following descriptions by referring to the COMPONENT LIST.

Item	Example
(1) Name of instrument	Selective Level Meter ML422B/C
(2) Name of component	COMPONENT LIST OF LOCAL
(3) CKT REF	C54
(4) Name of component	ECQ-M1H 472KZ  Note:  Part name is given in parentheses ( ) in the C.L. (Component List). Components with asterisks* are those that require factory adjustment upon repairing. When ordering a component or components with asterisk, give full description of the component.
(5) Quantity	1
(6) Serial No. of instrument	M31257

J 3	Connector, (225J-22821-587)	28 pins × 2		
J 4	Connector, (HNC2-2.5P-3DSL)	3 pins		
J 5	Connector, (U-PA0519)	5 pins		
J 6	Connector, (U-PA2219)	22 pins		
J 7	Connector, (HIF-3-26P-2.54DSA)	26 pins		
J 8	Connector, (HIF-3-26P-2.54DSA)	26 pins		
J 9	Connector, (225J-22821-587)	28 pins × 2		
R 1	CF, (ARD25T103J)	10kΩ, ±5%, 1/4W		
S 1	Switch, (AS1D-2M)
