1. SAFETY INSTRUCTIONS

Read this page carefully before installation and use of the instrument.

The following clauses contain information, cautions and warnings which must be followed to ensure safe operation and to retain the instrument in a safe condition.

Adjustment, maintenance and repair of the instrument shall be carried out only by qualified personnel.

1.1 GENERAL CLAUSES

- 1.1.1 **WARNING:** The opening of covers or removal of parts, except those to which access can be gained by hand, is likely to expose live parts and accessible terminals which can be dangerous to life.
- 1.1.2 The instrument shall be disconnected from all voltage sources before it is opened.
- 1.1.3 Bear in mind that capacitors inside the instrument can hold their charge even if the instrument has been separated from all voltage sources.
- 1.1.4 **WARNING:** Any interruption of the protective earth conductor inside or outside the instrument, or disconnection of the protective earth terminal, is likely to make the instrument dangerous. Intentional interruption is prohibited.
- 1.1.5 Components that are important for the safety of the instrument may only be renewed by components obtained through your local Philips organisation.
- 1.1.6 After repair and maintenance in the primary circuit, safety inspection and tests, as mentioned in Section 7 must be performed.

CHARACTERISTICS AND PERFORMANCE TEST

CHARACTERISTICS

For the characteristics of the PM2534 and PM2535 refer to chapter 2 of the operating manuals of these instruments.

The hardware of the PM2534 and the PM2535 is almost identical. Differences are indicated where necessary.

PERFORMANCE TEST FOR THE PM2534 AND PM2535

The meter should be calibrated and in operating condition when the customer receives it.

The following performance tests are provided to ensure that the meter is in a proper operating condition. If the instrument fails any of the performance tests, then calibration adjustment and /or repair is needed. To perform these tests, you will need a :

- * Fluke 5700 A Multifunction calibrator (or equivalent).
- * Philips PM9264/01 four wire OHM cable.

Each of the measurements listed in the following steps assume the instrument is being tested after a one-hour warmup, in an environment with an ambient temperature of 18 to 28°C, and a relative humidity of less than 80 %.

NOTE: All measurements listed in the performance test tables are made in the initial measuring speeds. These speeds are automatically switched on when the functions are selected.

The ranges of the meter must be selected in the manual ranging mode.

PROCEDURE

1. Power-up the meter and allow it to stabilize for one hour.
2. Connect a cable from the output HI and LO connectors of the Fluke 5700 A to the V-Ω-mA and 0 connectors on the PM2534/PM2535.

Select the function and range on the meter and the input level from the calibrator using the values listed in the tables.

The display should read between the minimum and the maximum values listed in the tables.

3. CIRCUIT DESCRIPTION

3.1. EXPLANATION OF THE BLOCK DIAGRAM (refer to figure 3.2)

The PM2534 can be subdivided into three parts.

1. Analog part
2. Digital part
3. Display-keyboard part

In the analog section all signals to be measured are converted into DC voltages. These DC voltages are attenuated by a DC attenuator or amplified by a DC amplifier.

AC voltages are attenuated by an AC attenuator or amplified by an AC amplifier. The signal is converted into a DC voltage and applied to a multiplexer.

For AC/DC current measurements two shunts are used, one for 30 mA and one for 3A measurement.

For resistance measurements the PM2534 uses a programmable current source.

For °C measurements a Pt-100 temp. probe (PM9249 e.g.) must be used. The measured analog signals are multiplexed, and via an ADC and a buffer sent to the microprocessor.

The digital part has as most important; the microprocessor (8031). The microprocessor takes care, together with the software in the ROM (and RAM) that the instructions are carried out.

It communicates via I²C bus. Also there are possibilities for connecting instruments with an IEC-625 and IEEE-488 bus.

System 21 can be connected as well.

In event of a microprocessor failure that mixes data and addresses the watchdog takes care of automatic initialisation. This causes an interrupt on the microprocessor.

The display is an LCD display and consist of 7 segments - and two numeric displays. It contains also status indicators.

The keyboard consists of sixteen pushbuttons to control and select the functions.

BLANK PAGE

BLANK PAGE

Figure 3.1

3.2 DETAILED DESCRIPTION

The PM2534 automatic multimeter can be subdivided into four functional sections, which are:

1. Analog section
2. Digital section
3. Interface
4. Display/keyboard section

The Analog section and the ADC are situated in the inguard section. The inguard section is the part of the instrument situated in an additional screening. The control section, display keyboard section and the interfaces are situated in the outguard section.

Figure 3.2 Block diagram

3.3 ANALOG SECTION

General

The analog section converts all the quantities to be measured into DC voltages which are then applied via a DC amplifier, or an AC amplifier and RMS converter, (in case of AC quantities) to the analog-digital converter (ADC).

All measuring functions are manually selected, but microprocessor controlled. The ranges can either be selected manually or automatically, also microprocessor controlled.

It is possible to start a measurement on the instrument and a provision is made to start external (TRIGGER).

3.3.1 V ... measurement

The input voltage to be measured is applied to a DC attenuator and a DC amplifier:

ST 4914
860228

Figure 3.3 V ... measurements

The attenuator is a thin film resistor network (R1101). The attenuation is switched by FET (V1101), amplification is switched by reed relay (K1102), both are controlled by microprocessor.

The combination of attenuation and amplification gives the ranges.

Range	Attn.	GAIN DC AMPL.	Range end
300 mV	1	10	
3 V	1	1	
30 V	100	10	
300 V	100	1	-3 V

A DC voltage of -3 V is applied to the ADC at positive input voltage.

The DC amplifier is a chopper-stabilised, low drift amplifier. It uses an integrated switching oscillator to chop the DC signal into a square wave. This signal can be amplified more easily. An equivalent drift voltage of approximately $0,01 \mu\text{V}/^{\circ}\text{C}$ can be obtained in this way. The DC input is chopped by an electronic switch, amplified and fed back to compensate for the offset voltage due to temperature drift.

The principle of the DC amplifier is shown in a simple diagram.

Figure 3.4 DC amplifier principle

The chopper-stabilised amplifier is a negative feedback amplifier, with a virtual earth.

When the switch is open, the gain is 10, when closed, the gain is 1.

NOTE: The LO input is not connected to circuit zero.

The resistors R1108 and R1109 are used to give an amplification of 10 (K1102 open) and an amplification of 1 (K1102 closed).

V1110 is closed before K1102 opens (make before break) to get always a defined amplification. R1110 and R1111 are used to give the gate of V1110 the same voltage as the source, so $U_{GS} = 0V$.

The current delivered by the chopper amplifier is too low, so V1111 is used to help the chopper amplifier.

Protection.

When a higher voltage is on the input sockets, than the range allows, the voltage on pin 6 of N1101 drifts to -4,5 V or +4,5 V (depending on the polarity of the input signal).

The result is that diodes V1102, V1104 and V1106 will conduct, and the voltage on pin 6 is clamped.

When the diodes start conducting, the output of the comparator (N1531) changes and this state is kept by the flip-flop D1531. It is indicated on the display as ↑ clipping, BSY will reset this (end of measurement).

Figure 3.5 Clip indication

V~ measurement

The input voltage to be measured is applied to the AC voltage attenuator where, by means of a RC networks switched by a FET, the attenuation factor is changed (figure 3.6).

The attenuated signal is then passed to the RMS converter which produces a DC signal between 0 and 3 V depending on the RNG input.

When measuring AC voltages, the series capacitor blocks any DC input. The 100x attenuation is achieved by V1301.

RANGE	ATTN.	0Q0068 sensitivity	RANGE END
300 mV	1	300 mV	
3 V	1	3 V	
30 V	100	300 mV	
300 V	100	3 V	3 V

In the RMS converter the difference between I_1 , and I_2 is converted into current in a dual V - I converter. The current is determined by V_{in}/R and the state of the RNG signal (where R is either R1308 or R1309). This RNG selects the input sensitivity of the RMS converter. The current in the AC-to-DC converter is rectified and then converted into a current again by the RMS section.

This current is proportional to the RMS value of the input signal.

Capacitor C1311 and C1310 provide the automatic zero (AZC) compensation for the RMS converter. The output of the RMS converter is converted into a voltage by resistor R1310. In the RMS converter there is also an output to indicate whether the crest factor has been exceeded. When point 9 of the OQ0068 becomes logic 1, the CF (point 9) indicates via latch D1531 to the microcomputer that the crest factor is exceeded. K1303 is closed during measurement.

With the filter pushbutton the measurable frequency range is shifted from 400 Hz (filter off) to 40 Hz (filter on). This is achieved with V1303 and V1304 which switch additional capacitors into the RMS circuit.

Figure 3.6 RMS converter

3.3.3 DC/AC current measurements

In the function A, two ranges are available (30 mA and 3 A). The ranges are determined by shunt R1153 and the input impedance of the ADC. The ranges are protected by fuse F1102. If the voltage across NTC R1152 becomes too high, the thyristor starts conducting and the fuse will blow.

Range	Shunt	DC ampl
+ 30 mA	150 mV	10x
+ 3 A	150 mV	10x

The AC input current ranges are shunted in the same way as the DC currents. The voltage from the shunt is supplied to the I_1 input of the RMS converter. Input I_2 of the OQ0068 is earthed via resistor R1307.

Range	Shunt	sensitivity via OQ0068
30 mA	150 mV	0,3 V
3 A	150 mV	3 V

3.3.4 Resistance measurement

The unknown resistance is connected between $V\Omega$ and 0 V input sockets and supplied internally by a constant current source (figure 3.7). This current results in a potential difference across the resistor that is proportional to the resistance value.

The unknown resistance may either be connected to the $V\Omega$ input socket for two-wire measurements in this way, or connected in a 4-wire configuration to the Probe socket using a four-wire test lead.

ST4968
860429

Figure 3.7 Current source

The measuring currents are derived from the current source which is built around N2101. By switching resistors in the feedback of this opamp it will change the currents.

RANGE	MEASURING CURRENT
3 kΩ	1 mA
30 kΩ	100 μA
300 kΩ	10 μA
3 MΩ	1 μA
30 MΩ	300 nA
300 MΩ	300 nA

On pin 3 half of the negative reference voltage is present. As the amplification of opamp N1201 is 1, the voltage across R1207 is 5 V : 2 = 2.5 V. This is valid when V1207 is closed. If transistor V1207 conducts, the voltage across R1207 will decrease to 250 mV. Depending on whether transistor V1205 and/or V1206 is openend, the current through the unknown resistor is changed or constant.

For 2-wire measurement, K1202 is closed, K1201 and K1203 are closed to perform 4-wire measurements. In this case (4-wire) the resistance of the measuring leads is compensated.

3.3.5 Temperature measurement

When ${}^{\circ}\text{C}$ is selected, the constant current 1 mA is routed from pin 2 of the probe connector X201 or X202, which is connected via the probe to one end of the Pt-100 resistance thermometer. The other lead is connected to earth. This current gives a voltage drop which depends on the resistance value across the Pt-100 probe. The voltage drop is measured via two other points of X201 or X202 (4-wire measurement). ${}^{\circ}\text{C}$ will give a voltage of 100 mV. The 100 mV offset is subtracted in the microcomputer so that ${}^{\circ}\text{C}$ will be displayed.

3.3.6 Multiplexer

All the measuring signals are supplied to a multiplexer. This multiplexer connects one input to the output (D1402 pin 3), depending on the code on pins 11, 10 and 9 of D4051. The signals are indirectly controlled by the μP .

3.3.7 Control of Analog Section

The selection of the analog measuring functions is made under μP control by the manually-selected or remote commands from the keyboard or interface.

Analog control actions are carried out from the μP . These actions are performed with the aid of an I²C device (I/O expander) and a part of the OQ0301.

3.3.8 Guard circuit

The front-panel guard can be internally connected (via a switch) to a shield that isolates the 0 (Lo) input socket of the PM2534 from ground (earth).

This shield increases the impedance between the LO terminal and ground to improve common-mode rejection, which gives an improved measuring accuracy, especially for small input signal.

The guard should be connected to the same input potential as the Lo input terminal. For asymmetrical inputs, this will usually be earth.

3.3.9 Analog to Digital conversion. (ADC)

3.3.9.1 General

The ADC converts the analog quantities to be measured into their digital equivalents for measurement by the μ P. The operating and timing functions for the ADC are derived from the μ P via the OQ0301. The basic principle used for the ADC is the conversion of analog signals into digital form by integration (the dual slope system).

Figure 3.8 Dual slope system

3.3.9.2 ADC principle

The quantity to be measured (the unknown voltage V_x presented to the input) is applied together with a precise reference voltage via switching circuits to an integrator stage. This integrator is followed by a comparator, as shown:

Figure 3.9 ADC principle

The integrator is charged linearly via the switch for a fixed time by an unknown voltage V_x , and then discharged over a variable time T_x by the reference voltage V_{ref} .

If the value of V_x is different, then the charging voltage amplitude is different (V_{c2}) and consequently the time taken to discharge is different. The fixed charging time T_m (ramp-up time) is measured by counting a pre-determined number of pulses in a counter (OQ0301). This counter is then used to count the number of pulses during the discharge time T_x (ramp-down time). The END of the ramp-down phase is detected by the comparator. This detection occurs as the integrator voltage reaches zero volts.

At the END of the ramp-up time, the polarity of the comparator output determines which reference voltage, $+V_{ref}$ or $-V_{ref}$ has to be chosen in the ramp-down period.

This depends on the input signal: a negative signal requires a positive reference voltage and vice versa.

3.3.9.3 Automatic zero

Incorrect Zero-crossing of the comparator can occur after the ramp-down phase because of drift offsets in the integrator and comparator circuits. This is eliminated in practice by automatic zero correction. During the AZC phase, the input of the integrator is short-circuited and any offset voltage of the integrator and comparator is loaded into a capacitor. This offset voltage is subtracted or added depending on polarity at the result.

3.3.9.4 DAC

A DAC is added in the ADC circuit to obtain higher resolution. The zero of the ADC is shifted every measurement to obtain the last digit of the reading.

Assume that the first measurement consist of 18201 points. After ten measurement the reading still will be 18201. By shifting the zero of the ADC in a positive or negative direction an extra digit is obtained. The counter which counts the pulses during the ramp-down period is stopped if the ramp-down signal crosses the zero. When the zero is next shifted the crossing will be on another point. If this is done ten times then there are also results with 18200 points. Adding these results and dividing them by 10 will give a reading with an extra digit.

In speed 1, 100 results are used in a similar way to obtain the last two digits.

3.3.10 Reference Voltage (Source + 5 V and - 5 V)

The reference voltage source circuit is shown in figure 3.10.

Figure 3.10 Reference Voltage

The current through V1452 must be 2 mA. This is performed with R1457, R1458, R1459 and R1460. The voltage drop is then 6,5 V with a very low temperature coefficient. The cathode of V1452 will be + 5 V, so between pin 2 and pin 3 must be 1,5 V.

The negative voltage is made with an inverter. The + 5 V is supplied to pin 2 from the N1406, and the output will be - 5 V. The resistors R1453, R1454, R1455, R1458, R1459 and R1460 are for adjustment.

3.3.11 Inguard-outguard connection

To reduce the influence of interference between the measuring circuits (INGUARD) and the digital circuits (OUTGUARD) the PM2534 is provided with a galvanic separation.

The galvanic separation consists of opto-couplers (H1802 - H1805). The communication between inguard and outguard is provided by the I²C bus.

On the bus the traffic is bi-directional. Two opto-couplers are used for the SCL line, and two opto-couplers are used for the SDA line. One optocoupler is used to indicate that the ADC is ready with a measurement. The OQ0300's are used to control the direction on the bus.

3.4 DIGITAL SECTION

The PM2534 uses the 8031 microcomputer and one ROM in the digital part to control the multimeter.

(For details of the 8031 refer to section 3.7.1)

3.4.1 Software description

The software carries out some routines to measure and evaluate the applied input signal. The main tasks of the software are mentioned here:

1. Output/input to the IEEE-488/IEC-625 interface.
2. Carry out the different trigger modes.
3. Perform the status byte.
4. Translate the input of the interface to a internal code.
5. Carry out all System 21 actions.
6. Read the function switch, data-hold probe etc.
7. Measure the input signal.

The last action can be subdivided into the following flow-chart.

Figure 3.11 Flow chart

The routines outlined in the main flow-chart can be outlined as follows.

SET-UP routine	This routine sets-up the OQ 0301. The microcomputer reads the calibrated value out of the RAM and sends it to the OQ 0301. The relay and FET switches in the analog part are set.
Measure routine	In this routine the PM2534 is measuring. It starts the measurement and collects the counts of the OQ 0301.
Calculate routine	This routine obtains the final measuring value from the following calculations. The following calculations may be made: - Calculate the temperature in the °C function (linearisation) - Calculate with the offset (subtract from measured value)
Output routine	The output routine translates the measure result to ASCII for display or interfaces.

3.4.2 RAM/ROM

The PM2534 has a 2 K or 8 K RAM (see Modifications 11.1 :9). In this RAM all the calibration values are stored. A battery G1601 supplies the RAM if the power is switched off. In the PM2535 a RAM of 8 kbytes is used. In this RAM, additional information is stored like burst measurements and sequence parameters.

The PM2534 has a 16 or 32 K ROM (see Modifications 11.1 :7), in the PM2535 a 32 K ROM is used.

External trigger circuit

Via the external trigger input a measurement can be started. When the input is pulled down, a pulse on pin 9 of D 1802 will interrupt the processor. After the interrupt, the processor starts a new measurement.

3.4.3 I²C bus

The I²C bus differs considerably from the conventional bus structures in that data-transfer is effected in a bit-serial, rather than in byte-parallel format.

In a conventional microcomputer such as the 8048 for instance, 12 address, 8 data and 4 control lines are necessary for parallel data transfer. The I²C 8440 microcomputer on the other hand requires only 2 lines to transfer serially the same amount of data. Chips used for ADC, RAM and LCD drivers are I²C compatible and also use the same two lines.

These two lines are respectively the SDL (serial data line) and the SCL (serial clock line), the function of which is to synchronise data-transfer between the appropriate I²C devices.

Almost any number of devices can be connected to the I²C bus. Each device is allocated its own specific 7-bit address which enables any two of these devices to communicate with each other upon receipt of a message prefixed with the appropriate 7-bit address.

This specific 7-bit address usually comprises a fixed address part (4 bits) and a user definable part (3 bits).

The latter is assignable by tying "Define Address" pins to high or low levels.

Address recognition is effected in the I²C interface hardware of each device and this eliminates the need for decoding logic. The use of an automatically invoked arbitration procedure, which prevents two or more devices from transmitting simultaneously, makes I²C technology eminently suitable for a multiprocessor system.

For further information about I²C see: Philips Data Handbook:
Integrated circuits for digital systems in radio, audio and video equipment.

3.5 IEEE/IEC INTERFACE

The IEEE/IEC interface processor communicates with the main processor via the I²C bus. It acts as a slave of the main processor. This interface processor handles the complete handshake of the IEC/IEEE interface.

3.5.1 Receiving

If the system controller sends a listen address (MLA) via the DIO lines (ATN is true), D1905 and D1906 are switched to the receive direction. Also via the hardware NDAC (no data accepted) is generated. The TA (talker active) signal is high so that the input of D1905 and D1906 (Special GPIB devices) is low. This means that a part of D1906 acts as input and another part as output.

D1906 ioutputs: NDAC, NRFD, SRQ

D1906 inputs: DAV, REN, ATN, EOI, IFC

Then the microcomputer starts handshaking the device address on the bus. If the device address on the bus is the same as the device address selected, the microprocessor starts to handshake in the other data bytes.

3.5.2 Transmitting

After the microcomputer has received MTA (my talk address) or in talk-only mode as described, the interface becomes talker. This means that D1905 and D1906 are now transmitters. The bytes on P0 are now data for the controller. If the interface becomes talker, it makes P13 low.

The GPIB device D 1906 is switched to the following configuration.

D1906 outputs: DAV, SRQ, EOI

D1906 inputs: NDAC, NRFD, REN, ATN, IFC

The PM2534 is now handshaking so that the bytes are sent to a controller or another device. At the end of the databytes the PM2534 generates EOI. The interface will remain talker until the Listener address is again on the bus, or after an IFC command is connected to the interrupt system of the interface.

3.6 DISPLAY/KEYBOARD

The PCF 8576 is a circuit designed to drive a Liquid Crystal Display with up to 160 segments. A 2-line I²C bus structure enables serial data transfer with the microcomputer.

A LCD is an AC device. Therefore, for multiplexing, the information of the segment line is important for each segment that will be driven by that line.

The reference voltage for the driver is obtained from transistor V2102 and zener diode V2101.

To change the viewing angle the reference voltage can be adjusted with potentiometer R2105.

On the same PCB the keyboard is situated. Pushing a switch will be read by the microcomputer via the I²C bus. This is done by scanning lines P0 to P7 to obtain which switch is pressed.

3.7 DATA OF COMPONENTS

3.7.1 8031AH single-component 8-bit microcomputer

- 8031AH - Control-Oriented CPU with RAM and I/O
- 128K Accessible External Memory
- 218 User Bit-Addressable Locations
- 128 x 8 RAM
- 32 I/O Lines (Four 8-Bit Ports)
- Two 16-Bit Timer/Counters
- Programmable Full-Duplex Serial Channel

The 8031AH is Intel's HMOS version of the High performance 8-bit 8031 microcomputer. While the 8031AH features the same powerful architecture and instruction set as its HMOS predecessor, it offers the additional benefit of lower power supply current.

The 8031AH provides a cost-effective solution for those controller applications requiring up to 64 Kbytes of program and/or 64 Kbytes of data storage. Specifically, the 8031AH contains 128 bytes of read/write data memory; 32 I/O lines configured as four 8-bit parallel ports; two 16-bit timer/counters.

Figure 3.12 Block Diagram

Figure 3.13 Pin Configuration

8031AH PIN DESCRIPTIONS

V_{SS}
Circuit ground potential.

V_{CC} 5V power supply input for normal operation and program verification.

Port 0

Port 0 is an 8-bit open drain bidirectional I/O port. It is also the multiplexed low-order address and data bus when using external memory. It is used for data output during program verification. Port 0 can sink (and in bus operations can source) eight LS TTL loads.

Port 1

Port 1 is an 8-bit quasi-bidirectional I/O port. It is also used for the low-order address byte during program verification. Port 1 can sink/source four LS TTL loads.

Port 2

Port 2 is an 8-bit quasi-bidirectional I/O port. It also emits the high-order address byte when accessing external memory. It is used for the high-order address and the control signals during program verification. Port 2 can sink/source four LS TTL loads.

Port 3

Port 3 is an 8-bit bidirectional I/O port with internal pullups. It also serves the functions of various special features of the MCS-51 Family, as listed below:

Port Pin	Alternate Function
P3.0	RXD (serial input port)
P3.1	TXD (serial output port)
P3.2	INT0 (external interrupt)
P3.3	INT1 (external interrupt)
P3.4	T0 (Timer/counter 0 external input)
P3.5	T1 (Timer/counter 1 external input)
P3.6	WR (external Data Memory write strobe)
P3.7	RD (external Data Memory read strobe)

P3.0	RXD (serial input port)
P3.1	TXD (serial output port)
P3.2	INT0 (external interrupt)
P3.3	INT1 (external interrupt)
P3.4	T0 (Timer/counter 0 external input)
P3.5	T1 (Timer/counter 1 external input)
P3.6	WR (external Data Memory write strobe)
P3.7	RD (external Data Memory read strobe)

The output latch corresponding to a secondary function must be programmed to a one (1) for that function to operate. Port 3 can sink/source four LS TTL loads.

RST

A high on this pin for two machine cycles while the oscillator is running resets the device. A small external pulldown resistor (-8.2kΩ) from RST to V_{SS} permits power on reset when a capacitor (-10μF) is also connected from this pin to V_{CC}.

ALE

Address Latch Enable output for latching the low byte of the address during accesses to external memory. ALE is activated at a constant rate of 1/6 the oscillator frequency except during an external data memory access at which time one ALE pulse is skipped. ALE can sink/source 8 LS TTL inputs.

PSEN

The Program Store Enable output is a control signal that enables the external Program Memory to the bus during external fetch operations. It is activated every six oscillator periods except during external data memory access. PSEN remains high during internal program execution.

EA

When held at a TTL high level, the 8051AH executes instructions from the internal ROM when the PC is less than 4096. When held at a TTL-low level, the 8031AH/8051AH fetches all instructions from external Program Memory. Do not float EA during normal operation.

XTAL 1

Input to the inverting amplifier that forms part of the oscillator. This pin should be connected to ground when an external oscillator is used.

XTAL 2

Output of the inverting amplifier that forms part of the oscillator, and input to the oscillator signal when an external oscillator is used.

3.7.2 MAF 8441 single-chip 8-bit microcontroller

DESCRIPTION

The MAB/F8441 is a device with 4K ROM/128 RAM bytes plus 8-bit LED-driver

It has 20 quasi-bidirectional I/O port lines, one serial I/O line, one single-level vectored interrupt, an 8-bit timer event counter and on-board clock oscillator and clock circuits.

This microcontroller is designed to be an efficient controller as well as an arithmetic processor. The microcontrollers have extensive bit handling abilities and facilities for both binary and BCD arithmetic.

For detailed informations see the "Users manual Single-chip microcomputers".

Features:

- 8-bit: CPU, ROM, RAM and I/O in a single 28-lead DIL package
- 128 RAM bytes
- 20 quasi-bidirectional I/O port lines
- Two testable inputs: one of which can be used to detect zero cross-over, the other is also the external interrupt input
- Serial I/O that can be used in single or multi-master systems (serial I/O data via an existing port line and clock via a dedicated line)
- Internal oscillator, generated with inductor, crystal, ceramic resonator or external source
- Over 80 instructions all of 1 or 2 cycles
- Single 5 V power supply ($\pm 10\%$)

Figure 3.14 Pinning

PINNING	DESIGNATION
V _{SS}	14 Ground
V _{CC}	28 Power supply, + 5 V
P00-P07	4-11 Port 0, 8-bit quasi-bidirectional I/O port
P10-P17	18-25 Port 1, 8-bit quasi-bidirectional I/O port
P20-P23	26, 27, 1, 2 Port 2, 4-bit quasi-bidirectional I/O port; P23 is the serial data I/O in serial I/O mode
SCLK	3 Bidirectional clock for serial I/O
INT/T0	12 External interrupt input (sensitive to a negative-going edge min LOW > 7 clock pulses, min HIGH > 4 clock pulses), testable using the JT0 or JNT0 instructions.
T1	13 Input pin, testable using the JT1 or JNT1 instructions. It can be designated as event counter input using the STRT CNT instruction. It can also be used to detect zero cross-over of slowly moving AC inputs.
RESET	17 Input to initialize the processor (active HIGH).
XTAL1	15 Connection to timing component (crystal) that determines the frequency of the internal oscillator. It is also the input for an external clock source.
XTAL2	16 Connection to other side of the timing component.

3.7.3 D/A convertor DAC-08 E

DESCRIPTION

The DAC-08 series of 8-bit monolithic digital-to-analog converters provide very high-speed performance coupled with outstanding applications flexibility.

Advanced circuit design achieves 85ns setting times with very low "glitch" energy and at low power consumption.

Figure 3.15 Block diagram

PIN CONNECTIONS

Figure 3.16 Pin connections

3.7.4 TL7705A, supply voltage supervisor (watchdog)

- Power-On Reset Generator
- Automatic Reset Generation After Voltage Drop
- Wide Supply Voltage Range ... 3 V to 18 V
- Precision Voltage Sensor
- Temperature-Compensated Voltage Reference
- True and Complement Reset Outputs
- Externally Adjustable Pulse Width

Description

The TL7702A series are monolithic integrated circuit supply voltage supervisors specifically designed for use as reset controllers in microcomputer and microprocessor systems. During power-up the device tests the supply voltage and keeps the RESET and RESET outputs active (high and low, respectively) as long as the supply voltage has not reached its nominal voltage value. Taking RESIN low has the same effect. To ensure that the microcomputer system has reset, the TL7702A then initiates an internal time delay that delays the return of the reset outputs to their inactive states. Since the time delay for most microcomputers and microprocessors is in the order of several machine cycles, the device internal time delay is determined by an external capacitor connected to the DT input (pin 3).

$$t_d = 1.3 \times 10^4 \times C_T$$

Where: CT is in farads (F) and td is in seconds(s)

3.7.6 SA 1045 P D²B driver comparator circuit

FUNCTION : Driver comparator Circuit
for Domestic Digital Bus
D²B.

PACKAGE : 8 pins plastic DIL SOT97C.1

Figure 3.19

PINNING

PIN	SIGNAL	TYPE		
1	V _{SS}	0 V Supply		
2	DBP	ODP/CI	IP	Input
3	DBN	ODN/CI	CI	Comparator Input
4	Compout	OP	OP	Push-pull Output
5	clock	IP	ODN	Open Drain N-output
6	LBD	IP	ODP	Open Drain P-output
7	LBS	OP		
8	V _{DD}	+ Supply		

The driver / detector chip consists of 3 main blocks:

- 1- analog driver / detector
- 2- digital filter
- 3- power-on-reset

1. The analogue driver / detector is a copy of the same part in the D²B-IC. It performs the driving and sensing of the D²B-lines. The sensing happens on certain levels with a certain hysteresis over a high common-mode-range. The driver is either tri-state or puts defined levels on the lines. This part meets the electrical D²B-specification.
2. The digital filter cannot follow high frequent changes on the bus lines and so performs the necessary noise-reduction. The input data must be stable within 2 clocks or it is not taken in.
3. The power-on-resets the whole chip at power-on. It resets the filter and switches off the analogue part.

The driver can be controlled by signal LBD, the output of the detection is LBS. DBN and DBP is the bus line I/O and Compout is the direct comparator output.

3.7.7 OQ0300 bus control

Description

The OQ0300 consists of two equal circuits with a common supply current source and voltage reference.

Each of these equal circuits interfaces one of the I²C bus lines to a pair of opto-couplers. One of these couplers transmits the I²C information to the other side of the galvanic separation while the other coupler receives information from the other side of the galvanic separation.

In case of a multimaster system, attention should be given to the over all propagation delay of the galvanic separation.

The OQ0300 can be adapted to the dark current - light current ratio of the photodiode used in the optocoupler.

The enable input enables both LED driver stages.

ST4948

Figure 3.20 Pinning

3.7.8 OQ 0301 ADC Control

General

The OQ0301 is designed as an ADC control circuit for a 3-phase integrating ADC system with I²C compatible serial data transfer. It contains three 24-bit serial in-parallel out shift register, a 23-bit synchronous counter which can be parallel loaded from one of the 3 shift-registers, a 24-bit parallel in-serial out shift-register for reading the result of the counter and a full comparator for timing possibilities of the counter.

Further, it contains the ADC-control logic for controlling a 3-phase integrating ADC circuit and a clock oscillator controlled by an external crystal.

The OQ0301 has an I²C-interface (with slave control).

The timing for the several phases is done by the OQ0301 and also the counting of clock pulses for the result of an ADC cycle:

Figure 3.21

If the ADC control is in the WAIT-state a start can be generated and the ADC control starts the UP-phase. The timing of the UP-phase is done by presetting a 23-bit synchronous upcounter and by upcounting until the counter is full.

Then the DOWN-phase is started. In the DOWN-phase the counter counts the clock pulses to get the result and is stopped by a COMP(arator) signal, which comes from the analog ADC-circuit. If in case of a fault the DOWN-phase is not stopped by the COMP signal, it will be stopped when the counter is full (therefore the counter is also presetable for the DOWN-phase to get a defined max. DOWN-timing in case of a fault). When the DOWN-phase is ready, the contents of the counter is transferred to the output shiftregister and the AZ-phase is started. The timing of the AZ-phase is done by presetting the counter and then by upcounting until the counter is full. After the AZ-phase is done, the ADC control goes to the WAIT-state and the next ADC-cycle can be started.

3.7.9 SAA1300 tuner switching circuit

The SAA1300 is used for switching on and off the supply lines of various circuit parts via an I²C bus signal. It contains 5 output stages which are capable of supplying up to 100 mA in the ON state or sinking up to - 100 µA in the OFF state. Current limiting and short-circuit protection are included.

3.7.10 PCF8574 remote 8-bit I/O for I²C bus

DESCRIPTION

The PCF8574 is a single-chip silicon gate CMOS circuit. It provides remote I/O expansion for the MAB8400 and PCF8500 microcomputer families via the two-line serial bidirectional bus (I²C). The device consists of an 8-bit quasi-bidirectional port and an I²C interface. The PCF8574 has low current consumption and includes latched outputs with high current drive capability for directly driving LEDs.

Features

- Operating supply voltage 2,5 V to 6 V
- Bidirectional expander
- Open drain interrupt output
- 8-bit remote I/O port for the I²C bus
- Latched outputs with high current drive capability for directly driving LEDs
- Address by 3 hardware address pins for the use of up to 8 devices (up to 16 possible with mask option)

3.7.11 OQ0068A AC/DC convertor (RMS)

DESCRIPTION

The OQ0068 is an integrated AC voltage to DC current converter for use in measuring equipment. The output current is proportional to the RMS value of the input voltage.

Special features are:

- Enable input for power-down mode
- Range input for selection of 2 resistor programmed ranges
- Crest Factor or Zero Crossing output selection
- Low leakage input clamp
- Automatic offset compensation

3.7.12 Linear LTC1052 chopper-stabilized operational amplifier

DESCRIPTION

The LTC1052 are low noise chopper-stabilized opamps manufactured using Linear Technology's enhanced LTCMOSTM silicon gate process. Chopper-stabilization constantly corrects offset voltage errors. Both initial offset and changes in the offset due to time, temperature and common-mode voltage are corrected. This, coupled with picoampere input currents, gives these amplifiers unmatched performance.

Low frequency (1/f) noise is also improved by the chopping technique. Instead of increasing continuously at a 3dB/octave rate, the internal chopping causes noise to decrease at low frequencies.

Figure 3.28 Pin connections

4. DISMANTLING THE INSTRUMENT

GENERAL INFORMATION

This section provides the dismantling procedures required for the removal of components during repair operations. All circuit boards removed from the instrument must be adequately protected against damage, and all normal precautions regarding the use of tools must be observed. During dismantling a careful note must be made of all disconnected leads so that they can be reconnected to their correct terminals during re-assembly.

CAUTION: Damage may result if:

- the instrument is switched on when a circuit board has been removed.
- a circuit board is removed within one minute after switching-off the instrument.

Disconnect measuring terminals before opening.

4.1 REMOVING THE COVER (Figure 4.1)

- Remove the fixing screws (rear and bottom of the instrument)
- Pull the cover back from the front
- Remove the plastic connecting rails

ST4969

Figure 4.1

4.2 REMOVING THE TOP SCREENING (Printed circuit board, component side)

- Remove the cover
- Remove the two fixing screws of the screening (bottom)
- Push the screening in the direction of the front
(figure 4.2 arrow 1)
- Lift up the screening (figure 4.2 arrow 2)

4.3 REMOVING THE BOTTOM SCREENING (Printed circuit board, conductor side)

- Place the instrument upside down
- Push screening in the direction of the rear (figure 4.2 arrow 3)
- Lift up screening (figure 4.2 arrow 4)

Figure 4.2

4.4 REMOVING THE FRONT ASSEMBLY

- Remove the cover
- Remove the screening
- Disconnect the front assembly from the motherboard
(by connector X2101)
- Bend out the two hooks of the front assembly at the component side
of the printed circuit board (figure 4.3)
- Pull back the front assembly

Figure 4.3

5. CHECKING AND ADJUSTING

5.1 GENERAL INFORMATION

The following information provides the complete checking and adjusting procedures. As various control functions are interdependent, a certain order of adjustment is necessary. The procedure is, therefore, presented in a sequence which is best suited to this order, cross-reference being made to any circuit which may affect a particular adjustment. Before any check or adjustment, the instrument must attain its normal operating temperature.

- Warming-up time under average conditions is 30 minutes.
- Where possible, instrument performance should be checked before any adjustment is made.
- All limits and tolerances given in this Section are calibration guides, and should not be interpreted as instrument specifications. The latter are published in the operating manual of this instrument.
- Tolerances given are for the instrument under test and do not include test equipment error.
- All controls which are mentioned without item numbers are located on the outside of the instrument.

5.2 CALIBRATION ADJUSTMENTS

The calibration adjustment procedure consists of two parts:

- Part A, to be used when components in the reference voltage circuit or the ADC circuit are replaced.
- Part B, to be used in all other cases.

PART A, adjustment of reference voltages and ADC

REFERENCE VOLTAGE ADJUSTMENT

If components in the reference voltage circuit are replaced, the reference voltage must be adjusted. Proceed as follows:

- Replace the wires 1 to 6 next to the resistors R1453, R1554, R1455, R1458, R1459 and R1460 if cut.
- Measure the voltage Uref between points P and N (Fig. 6.5, bottom right hand corner) with an accuracy better than 0.1 %.
- Depending on the measured Uref, the wires indicated in the table below with an asterisk (*) must be cut.

Uref>	1	2	3	4	5	6
10.00	-	-	-	*	*	*
10.20	-	-	*	*	*	-
10.40	-	*	-	*	-	*
10.55	-	*	*	*	-	-
10.70	*	-	-	-	*	*
10.85	*	-	*	-	*	*
11.00	*	*	-	-	-	*
11.15	*	*	*	-	-	-

- Measure again the voltage between point P and N. If the voltage is lower than 10.00 volt replace the wires again and choose a value in the table which belongs to a lower value of Uref.

ADC ADJUSTMENT

If components in the ADC circuit are replaced, or when the instrument must be set to another mains voltage frequency (see chapter 7), the dead band zero must be adjusted.

Proceed as follows:

- Set the instrument in function Vdc, range 3 V and speed 2.
- Supply alternating a voltage of +0.3 mV and -0.3 mV to the input
- Replace R1424 with a resistance box (5 kOhm up to 20 kOhm, steps according to the E96 resistance series). Adjust the resistance value until the difference between the displayed values for an input voltage of +0.3 mV and -0.3 mV is 60 counts \pm 1 count. Only the difference between the indications is important!
- Replace the resistance box with a resistor (MR25, E96, 1%) of the found value

example: +0.3 mV shows 0.00020 V difference = 60 counts
 -0.3 mV shows -0.00040 V

PART B, CALIBRATION ADJUSTMENT

PROCEDURE (See figure 5.1)

- Via the CAL switch (pencil operation) the CALIBRATION ENABLE mode is entered. While pressing the CAL switch, the RESET switch must be pressed. Release the RESET switch before releasing the CAL switch. In the CALIBRATION ENABLE mode the instrument is normally measuring.
- Press the CHECK key (PM2535 SHIFT CHECK) to start CALIBRATING
- Select the FUNCTION and RANGE to be calibrated with the FUNCTION and UP/DOWN keys respectively
- supply the required INPUT SIGNAL (see tables on page 5-5 to 5-9) to the input terminals
 The accuracy of the input signal, mentioned in the table part B is 5 times better than the 90 days accuracy of the meter.
- press SINGLE TRIGGER to calibrate.
 If the calibration is successfull, the meter responds with a r (ready) at the end of the displayed value.
 If the supplied signal is not correct (out of range), or the range cannot be calibrated the meter responds with FAIL.
- Repeat this procedure for all functions and ranges to be calibrated.

By pressing the END (SHIFT CHECK for the PM2535) key, the meter leaves the CALIBRATION MODE, but stays in the CALIBRATION ENABLE mode.
 After RESET or POWER ON the CALIBRATION ENABLE mode is left.

Flow chart of the CALIBRATION ADJUSTMENT procedure:

Figure 5.1 Calibration adjustment procedure

RECOMMENDED CALIBRATION EQUIPMENT:

- * Fluke 5700 calibrator
- * Valhalla 2724A Programmable resistance standard for the resistance ranges up to and including 3 MΩ; not for the ranges 30 and 300 MΩ !
- * Resistance box 8122 240 29971 for the 30 MΩ and 300 MΩ ranges. The box, providing a 30 MΩ and 300 MΩ resistance with the required accuracy can be ordered at the T&M Supply Centre Almelo in the Netherlands.

5.3 ADJUSTING THE PM2534/PM2535 USING A CONTROLLER

The calibration mode can be called via the IEC/IEEE-bus.
 To use this feature, a program string must be sent to the PM2534/PM2535. First the calibration enable mode must be entered. (Press the CAL and RESET switch and release the RESET switch before releasing the CAL switch).
 Via the command CAL ON the calibration mode is enabled.
 To calibrate a function with a range, select via the commands described in the operating manual, the function and range. The calibration can be started by sending a trigger command "X1" or "GET". After the calibration is finished the next function/range can be selected. The calibration mode is left by sending CAL OFF to the instrument. By this the calibration enable mode is entered again.

Figure 5.3 Flow-chart

Example with P2000C controller (cal enable mode already entered!)

```

10 IEC INIT
20 IEC PRINT #22, "CAL ON"      : cal-mode enabled
30 IEC PRINT #22, "FNC VDC"     : function volt DC
40 IEC PRINT #22, "RNG 30"      : range 30 volt
50 IEC PRINT #22, "X1"          : trigger
60 IEC PRINT #22, "CAL OFF"     : cal enable mode entered
70 IEC END
  
```

6. CORRECTIVE MAINTENANCE

6.1 SPECIAL PARTS

In addition to the standard electronic components, some special components are used:

- Components, manufactured or selected by Philips to meet specific performance requirements.
- Components which are important for the safety of the instrument.

ATTENTION: Both type of components may only be replaced by components obtained through your local Philips organisation or representative. These components have been marked in the Parts List by a *.

6.2 REPLACING PARTS

NOTE: SWITCH OFF MAINS BEFORE REMOVING PARTS.

6.2.1 Parts on the PCB

- Dismantle PM2534 (refer to section 4.1)
- Remove screening

6.2.2 LX- display, window and interconnection rubber

- Dismantle PM2534 (refer to section 4.1)
- Remove screening (refer to section 4.2)
- Remove front assembly (refer to section 4.4)
- Bend out the six hooks and lift the PCB out of the front assembly (figure 6.1)
- Push the attach hooks out of the holes at the component side of the PCB and lift the LCD display from the PCB (see figure 6.2).

ST4974

Figure 6.1

The assembly of the display consists of four main parts (figure 6.2). All parts can be replaced separately.

ST4975

Figure 6.2

6.2.3 Input unit

- Dismantle the PM2534 (refer to section 4.1).
- Remove the screening (refer to section 4.2).
- Remove the fixing screw (figure 6.3).
- Pull out the input from the front assembly.
- Remove the wires from the input unit.
- Remove fixing screw in the fuseholder.
- Desolder the two wires of the switch.
- Lift-up PCB.
- Take care of the contact springs (ZERO and GUARD).
- Demount switch by using a pair of tweezers (be careful not to break the plastic mounting pins).

ST4976

Figure 6.3

6.2.4 Interchanging input unit (figure 6.4)

- It is possible to mount the input unit at the rear, often used in system configuration.

To do this proceed as follows:

- Dismantle PM2534
 - Remove screening
 - Remove fixing screws (front and rear) from the input unit front and the coverplate (rear)
 - Pull the input unit out of the front assembly
 - Remove the wires from the input unit
 - Remove coverplate at the rear
 - Place coverplate in front assembly
 - Connect the input cables and place the input unit in the rear
 - Screw coverplate and input unit to the instrument
- | | |
|---------|---------------|
| Tp 1010 | RED = VΩ |
| Tp 1009 | BLACK = 0 (V) |
| Tp 1006 | BLEU = guard |
| Tp 1007 | BROWN = A |
| Tp 1008 | GREY = 0 (A) |

ST4977

Figure 6.4

6.2.5 Fuses

Change fuse on the input unit

- Remove fixing screw in the input unit
- Pull the input unit out of the frontassembly
- Replace fuse F1102 3,15A Fast blow

Change fuse F1901 on the motherboard (SYST 21)

- Dismantle PM2534
- Replace fuse F1901 200 mA Slow blow

6.3 TROUBLESHOOTING

The troubleshooting can be subdivided into two parts.

A: NORMAL MEASUREMENTS

For measurements with a multimeter and oscilloscope, the testpoints on the printed circuit board can be used.

This part provides a diagram with testpoint locations (figure 6.5), and an overview of wave forms and voltages on these testpoints. The testpoint numbers correspond with those in the circuit diagrams (section 9).

Built-in tests are provided for the RAM, ROM and display (page 6-12)

A switching table, indicating the status of switching FETS and relays is given on page 6-13.

B: REPAIR BY SIGNATURE ANALYSIS USING A TESTROM.

Repair can be done with the aid of a testrom (ordering code 5322 694 54039). In this testrom, tests are implemented for signature analysis, ADC and display testing.

If repair has to be carried out, the following points should be taken into account in order not to damage the instrument.

- Take care to avoid short-circuiting with measuring clips
- Use a miniature soldering iron (35 W max.)
- Use an acid-free solder
- After repair, the instrument should be calibrated (section 5)

Built-in tests

The ROM, RAM and display of the PM2534 and PM2535 can be tested by the standard software of the instrument. These tests only indicate a failure (ERROR on display); they do not locate the faulty component.

To activate the PM2534 test proceed as follows:

- Push 4 times the "CHECK" switch. Display ==> tEst 0
 - Push the "1" switch. Display ==> tEst 1
 - Push the "END" switch. START of internal tests

To activate the PM2535 test proceed as follows:

- Push the "SHIFT" switch.
 - Push the "CHECK" switch.
 - Push 3 times the "ENTER" switch. Display ==> tEST 0
 - Push the "1" switch. Display ==> tEST 1
 - Push the "ENTER" switch. START of internal tests

The flow chart below shows how to select the tests after the procedure described above has been carried out.

Figure 6.6 Built-in tests

In the display test of the PM2534, the following is displayed:

Figure 6.7 PM2534 display in display test

In the display test of the PM2535, the following is displayed:

Figure 6.8 PM2535 display in display test

Table of control signals for relays and FETs:

x depends on FILTER ON/OFF

filter on : x = 1

filter off: $x = 1$

*a and *b depend on MEASURING SPEED: speed 1+2 : *a = 0 ; *b = 1
speed 3+4 : *a = 1 ; *b = 0

1 = 0 Volt (+6 Volt for D1401); relay contact closed, FET conducting
0 = -6 Volt; relay contact open, FET not conducting

PART B Tests with Signature Analysis and Testrom

Brief description of Signature Analysis.

1. General

For repair by signature analysis a testrom has been developed. This testrom enables the user to test the digital part of the PM2534 by means of Signature Analysis.

Troubleshooting is now possible to component level by a circuit under test, by comparing the actual signature with the correct one.

In total there are 10 tests. In the testrom, 9 tests have been implemented and one test is made with the free-run facility of the PM2534.

2. Why use a Signature Analyser?

When using a microcomputer, the bus structure is very complex. In case of a failure, it cannot be analysed with an oscilloscope or voltmeter. The signature analyser can be used now. Finding faults in a difficult bus system can best be done by opening the feedback part, and then it will become easy.

Brief description of the tests.

Free-run test:

With this test it is possible to measure signatures on the address latches and the databus of the processor. This is necessary to check if the data can be taken from the testrom.

Test 0 (digital part and galvanic separation).

This test checks the I/O parts and the galvanic separation between inguard and outguard.

Test 1 (I^2C bus and switch decoding)

In this test the I^2C lines are checked. Also the decoding of the switches on the display pcb are tested.

Test 2 - Test 4 (ADC)

These tests are for testing the ADC. A voltage (depends on which test) on the input of the ADC is present. In the ADC circuit the various voltages can be measured.

Test 5 - Test 9

With these tests the display is tested. A short-circuit between two segments, backplanes etc. can be seen on the display.

3. Free-run test

- Remove jumper S1702
- Signals with a * seem to be logic 0 or logic 1 but still show activity (blinking LED)
- Reference: logic 0 = 0000
logic 1 = 0003

A 10	pin 23	37C5	
A 11	pin 24	6U28	
A 12	pin 25	4FCA	
A 13	pin 26	4868	
A 14	pin 27	94P1	
A 15	pin 28	0002	

For measuring signatures on the data bus the clock must be connected to ALE (D1701 pin 30). On the signature analyser the falling edge of the clock must be selected.

Setting	Edge mode	Connections	Testpoint	Signal name
clock		clock	A	ALE

SIGNATURES ON THE DATA BUS

DATABUS	D1701	SIGNATURES
D 0	pin 39	UUUU
D 1	pin 38	FFFF
D 2	pin 37	8484
D 3	pin 36	P763
D 4	pin 35	1U5P
D 5	pin 34	0356
D 6	pin 33	4759
D 7	pin 32	6F9A

If a PM2544 signature analyser is used, the following can also be measured.

Frequencies: { D1701 pin 18 XTAL/1 and 19 XTAL/2, 12 MHz
{ D1701 pin 29 PSEN and 30 ALE, 2 MHz

TEST EXT.START CIRCUIT

Time measurements

Short-circuit the EXT TRIG input to earth.
The time measured must be between 40-150 us.

TEST WATCHDOG

Short-circuit test pin W to earth.
The time measured must be between 200-600 msec.

4. Test 0

- Switch off the POWER and remove the EPROM D1703
- Check your testrom type, it must be a 256 K type (27256); if it is a 64 K type (2764), refer to section 10.1 Modification 6.
- Place the TEST ROM in the socket of D1703.
- Connect the anode of V1703 (located near D1703) to test pin 0 (zero outguard, see figure 6.5 on page 6-7), to avoid a reset of the RAM
- Connect test pin -L (logic supply -6 V inguard) to the zero of the +5 V outguard supply (test pin 0, refer to figure 6.5 on page 6-7).
- Switch on the meter (the display shows tEST 0) and measure the signatures as given on the next pages.

- Signals with a * seem to be logic 0 or 1 but still show activity (blinking LED)
- Reference: logic 0 = 0000
logic 1 = 82CP

Setting signature analyser

Setting	Edge/Mode	Connections	Testpoint	Signal name

11	C631	23	CCAA
12	0000	24	CCAA

RES SYS 21 (27)

The next signatures must be measured on test pin S (outguard). If an IC, connected with the I²C bus, is receiving data, it sends back an acknowledge. If no acknowledge is received from that I²C, the signature changes.

All I²C integrated circuits ok, signature: 0462 (RES SYS 21 (27))

The following signatures can be measured on pin S if the devices mentioned in the table not sending acknowledge:

IC's not sending acknowledge	SIGNATURES
ALL IC's OK	0462
D1404	781H
D1511	067U
D1512	APC9
D1513	1H56
D1902	C8P9
D2101	P02C
D2201	31C4

5. Test 1 (I²C devices)

- Select test 1 with S1701 (test 1 on display)
- Reference: logic 0 0000
logic 1 CCAA
- The anode of V1703 must be connected to test pin 0.(zero outguard) to avoid reset of RAM
- Test pin -L (inguard) must be connected 0 (zero outguard)

Setting signature analyser

Setting	Edge/Mode	Connections	Testpoint	Signal name

7	P8FH	15	0000
8	2656	16	0000

6. Test 2, 3 and 4 Description of the tests

Tests 2, Test 3 and Test 4 are in principle the same tests, they test the ADC with different voltages on the input.

Voltage on pin 3 of D1402 in TEST 2 = -3 V

Voltage on pin 3 of D1402 in TEST 3 = +0,6 V

Voltage on pin 3 of D1402 in TEST 4 = 0 V

- Test 2 signals

Test 2 can be selected with S1701 (Test 2 on display)

Figure 6.9 Test 2 signals

- Test 3 signals

Test 3 can be selected with S1701 (Test 3 on display)

Figure 6.10 Test 3 signals

- Test 4 signals

Test 4 can be selected with S1701 (Test 4 on display)

ST4983

900126

Figure 6.11 Test 4 signals

7. Test 5-9

Test 5 - Test 9 are for testing the display (visual), they can be selected with S1701.

- Test 5

In test 5 all segments are on.

ST4962

Figure 6.12 Test 5 signals

Test 6

In this test all even segments (S_0, S_2, S_4 - etc.) are on.

ST4963

Figure 6.13 Test 6 signals

Test 7

In this test all odd segments (S_1, S_3, S_5 , etc.) are on.

ST4964

Figure 6.14 Test 7 signals

Test 8

All segments from backplanes 1 and 3 are on.

Figure 6.15 Test 8 signals

Test 9

All segments from the backplanes 0 and 2 are on.

Figure 6.16 Test 9 signals

7. SAFETY INSPECTION TESTS AFTER REPAIR AND MAINTENANCE IN THE PRIMARY CIRCUIT

7.1 GENERAL DIRECTIVES

- Take care that the creepage distance and clearances have not been reduced.
- Before soldering, the wires should be bent through the holes of solder tags, or wrapped around the tag in the form of an open U, or Wiring ridigity shall be maintained by cable clamps or cable lacing.
- Replace all insulating guards and plates.

7.2 SAFETY COMPONENTS

Components in the primary circuit may only be replaced by components selected by Philips, see also 8.

7.3 CHECKING THE PROTECTIVE EARTH CONNECTION

The correct connection and condition is checked by visual control and by measuring the resistance between the protective lead connection at the plug and the cabinet/frame. The resistance shall not be more than 0,5 Ohm. During measurements the mains cable should be removed. Resistance variations indicate a defect.

7.4 ADAPTATION TO THE LOCAL MAINS

For adaptation to the local mains the wiring positioned under the mains transformer must be altered.

Proceed as follows:

- Remove the cover
 - Change the drawing as shown in figure 7.1 (230 V, 1 connection; 115 V, 2 connections).

Figure 7.1 Adaption to the local mains

7.5

ADAPTATION TO THE LOCAL MAINS FREQUENCY

For adaptation to 60 Hz the 5 MHz X-tal (C1401) must be changed for a 6 MHz X-tal (codenr. 5322 242 74364). Also a new adjustment must be made for the ADC control (refer to Chapter 5 page 5.4 adjustment number 2).

Figure 7.2

8. PARTS LIST

NOTE: if a component is marked *x (x is a number), you must refer to modification x, in Section 11, "MODIFICATIONS".

10. GLOSSARY OF TERMS

A0-A14	Address lines
ALE	Address Latch Enable
ATACK	Attention acknowledge
ATN	Attention
ATNR	Attention received
CAL	Calibrate
CFI	Crest factor indication
D0-D7	Data lines
DAV	Data valid
DAVS	Data valid send
ENINI	Enable I ² C transport
ENINT	Enable interrupt
EOI	End or identity
EOIS	End or identity send
EXINT	External interrupt
IECINT	IEC interrupt
IFC	Interface clear
IFCR	Interface clear received
INTK	Interrupt keyboard
NDAC	No data accepted
NRFD	Not ready for data
OL	Overload (on display ↑)
PSEN	Program store enable
RxD	Receive data
RDYSYS	Ready System 21
RD	Read data
REC	Receive
REF+	Positive reference
REF-	Negative reference
REN	Remote enable
RENR	Remote received
RESET	Reset
RESSYS	Reset System 21
RFDS	Ready for data send
SCL	Serial clock
SDA	Serial data
SRQ	Service request
TXD	Transmit data
TA	Talker active
TRISYS	Trigger System 21
WDRES	Watchdog reset
WR	Write

MODIFICATIONS

11.1 Hardware modifications

Modifications described in this manual are indicated on the relevant place in this documentation by a mark *x or

mark the number (x) corresponds to the modification number described below

Printed circuit board versions

For some modifications reference is made to the printed circuit board version. This number is placed on the left front edge of the p.c.b. component side. It becomes visible when you remove the front assembly, refer to section 4.4.

The following pcb versions are used:

- | | |
|-----------------|--|
| 4022 325 8051.2 | First pcb version delivered.
Used in the:
PM2534 up to serial number DY0102166
PM2535 up to serial number DY0101370 |
| 4022 325 8051.3 | Modifications in the previous pcb are incorporated in the print lay-out.
Used in present deliveries of the PM2534 and PM2535. |
| 4022 325 8051.4 | Minor modifications; positioning of IEEE-bus connector X1902 improved.
Used in future deliveries of the PM2534 and PM2535. |

Modifications

1. Problem: non-linearity
- Cause: deviation in the ADC
- Remedy: additional ADC adjustment
- Action: in case the meter shows a non-linear behaviour, you must adjust the DEAD BAND ZERO, as described in section 5.2, part A-2 (page 5.4).
The adjustment can be carried out in all instruments. In old instruments no solder pins for R1424 may be provided.

2. Problem: reference numbers of the reference voltage adjustment wires not indicated.
- Remedy: drawings are updated.
3. Problem: instability in the Vac ranges.
- Cause: interference susceptibility of C1407.
- Remedy: C1407 must be mounted with the marking (bar) at the correct side.
- Action: Check the mounting position of C1407 if the instrument shows instability on the Vac ranges (see MAIN pcb lay-out).
4. Problem: instability in the 300 mV dc range, speed 4
- Cause: introduction of a new, VDE approved, mains transformer (T1601).
- Remedy: the screen (pin 9) of the transformer is disconnected from the guard and connected to the zero of the in-guard supply (pin 11 of the transformer).
- Action: if you replace an old transformer T1601 by a new one, you must:
- cut the trace between T1601:9 and test pin G (uard) at the component side of the main pcb (version 4022 325 80512)
- interconnect pins 9 and 11 of T1601 at the conductor side
- Old transformers are marked with number 4022 369 7063x; new transformers with 4022 369 7100x. The x is the version number. Transformers delivered by Concern Service are of the new type. For ordering code see PARTS LIST 8.2.5.
5. Problem: the Vdc ranges are out of specification within the re-calibration period.
- Cause: long term drift of the ADC reference zener diode V1452.
- Remedy: the diodes are aged before use; pre-aged diodes are marked with a black bar in the axial direction.
- Introduction: Aged diodes are used in the:
PM2534, from DY0101520 onwards
PM2535, from DY0100908 onwards

Action: if an involved instrument goes out of its specification within the re-calibration period, you must replace V1452 by an aged type (marked with a black bar). See PARTS LIST 8.2.3. for the ordering code.

6. Concerns: test ROM D1704

Modification: - the test ROM socket will be omitted
 - a 256 K instead of a 64 K EPROM is used for the test programs. The test software has not been changed!

Reason: - socket not required
 - as the socket is omitted, the test ROM must be fitted in the firmware EPROM socket. If the firmware EPROM is a 256 K type (PM2535 and later versions of the PM2534, see modification 7), a 64 K test ROM can not be used. The 256 K test ROM can be used in all instruments!

Action: order a new test ROM 5322 694 54039; the 256 K type will be delivered.
 If you have already a 64 K test ROM, you can load its contents into a 27C256 EPROM. In this case it must be loaded twice, the first time starting at address 00000 (start address when A14 is low), the second time starting at address 04000 (start address when A14 is high, PM2534 old versions). You can use the old (64 K) testrom in the PM2534 if it is provided with a 128 K firmware EPROM:
 - in the firmware EPROM socket: S1702 in position Normal Operation
 - in the test rom socket (D1704), if provided: S1702 in Test Operation

7. **Modification:** the PM2534 firmware is loaded in a 256 K EPROM (was a 128 K EPROM).
 As a consequence the print has been modified as follows:
 address line A14 of the EPROM (D1703:27) is disconnected from the +5 V supply (+Vs) and then connected to A14 of the μ P (D1701:27).

Reason: In the PM2535 also a 256 K EPROM is used.

Introduction: the 256 K EPROM is introduced in the:

PM2534 from DY0102160 onwards,
 with software version S04
 PM2535 in all instruments

Action: if you want to replace a 128 K firmware EPROM of a PM2534 by a 256 K EPROM (for a software update to S04 or later), you must:
 - remove the socket for D1703 carefully
 - cut the trace between D1703:27 and D1703:28 (component side of main p.c.b. 4022 325 80512)
 - fit the socket
 - interconnect D1703:27 and D1701:27 at the solder side of main pcb 4022 325 80512.
 If you order a firmware EPROM you will receive the latest version. For ordering codes see PARTS LIST 8.2.4, page 8-10.

8. **Problem:** Instrument "hang-up"

Cause: The interference immunity is insufficient.
 The meter is sensitive to voltage spikes.

Remedy: 1. a new version of the OQ0300, version 4, is installed.

2. the I²C bus in-guard/out-guard isolation circuit has been modified:
 - H1802, C1513, R1518 and R1822 omitted
 - pins 4 (emitter) and 5 (collector) of optocouplers H1803, H1804 and H1805 are interconnected

3. the GUARD terminal is connected to the instrument guard via a $1\text{ k}\Omega$ resistor R1604 in one of the following ways:

- 1) according to the figure below

ST5262

- 2) the guard track to TP1006 is cut. A $1\text{ k}\Omega$ resistor is soldered across the cut.

Introduction: Modification 1 is introduced in the:
 PM2534 from DY0101620 onwards
 PM2535 from DY0100961 onwards

Modifications 2 + 3 are introduced in the:
 PM2534 from DY0101808 onwards
 PM2535 from DY0101061 onwards

- Action:**
1. Replace D1501 and D1801 with version 4 types if old types are installed. Concern Service delivers the new types. For ordering codes see page 8-10.
 2. - Remove H1802, C1513, R1518, R1822
 - Interconnect pins 4 and 5 of H1803, of H1804 and of H1805
 3. Cut the track between TP1006 and the big solder spot at the other end of this track (see Main pcb 4022 325 80512, solder side). Solder a $1\text{ k}\Omega$ resistor (4822 116 51235) across the cut.
9. **Modification:** In the PM2534 the $2\text{K} \times 8$ RAM D1705 has been replaced with a $8\text{K} \times 8$ RAM. The socket for D1705 is omitted.
- Reason:** same RAM for the PM2534 and the PM2535
- Action:** use the correct type for replacement.
10. NOT USED.

11. Problem: deviation of the 0 Vac indication
- Cause: the selection procedure of the OQ 0068 RMS converter was not carried out correctly.
- Remedy: the OQ 0068 is selected in the correct way.
- Introduction: Correct OQ 0068 IC's are used in:
- PM2534, from DY0102521 onwards
PM2535, from DY0101612 onwards
- Action: if an involved instrument shows a deviation of zero on the Vac ranges with the input shorted, you must replace D1301. OQ 0068 deliveries from Concern Service are correct and are marked with a paint dot. For ordering see PARTS LIST 8.2.4, p 8-10.
12. NOT USED
13. Modification: - for C1902 and C1903 other capacitance values are used: 5p6 instead of 33pF.
- R1905 is omitted
- another type is used for IEEE bus controller D1902: PCF84C41 instead of MAF8441
- Reason: to fulfill the demands of IEEE488-2 and to limit the power consumption.
- Introduction: PM2534 from DY0103168 onwards
PM2535 from DY0102131 onwards
- Action: if you replace D1902 type MAF 8441 with a PCF 84C41, you must also replace C1902 and C1903 by 5p6 capacitors, and remove R1905. For ordering codes see PARTS LIST 8.2.1 (page 8-4) and 8.2.4 (page 8-10).
14. Modification: some TTL IC's are replaced with CMOS IC's.
It concerns:
D1701, P8031AH ----> P80C31BH
D1702, 74LS373 ----> 74HC373
D1703, 27256 -----> 27C256
- Reason: to limit the power consumption.
- Introduction: PM2534 from DY0103168 onwards
PM2535 from DY0102131 onwards
- Action: if a RS232 interface must be installed, you must carry out this modification, in combination with modification 13. For ordering codes see page 8-10.

11.2 SOFTWARE MODIFICATIONS.

Software modifications are indicated on the relevant place in the documentation by modification number 50

Software versions PM2534

Modifications S02 ----> S03

Nr. Concerns Description

- 1 2534-2535 processing of the ADC DEAD BAND ZERO adjustment is improved

Modifications S03 ---> S04

The following errors in S03 have been corrected and improvements are introduced:

Nr.	Concerns	Error in S02/S03 - improvement in S04
1	2534	"return to local" procedure must be: - press CHECK (rtl 0 on display) - press 1 (rtl 1 on display) - press END ---> meter returns to local In S03 the meter also returns to local when rtl 0 is displayed (1 not pressed) and then END is pressed.
2	2534	the display does not always indicate "TALK ONLY" when the talk only mode is selected via the keyboard. However this has been improved, it can still happen in S04.
3	2534-2535	if NULL is pressed (300 mV dc) when the FILTER is on, the displayed value is not 000.0000 mV (at a stable input signal).
4	2534	in the internal trigger mode is the BUSY bit of the status byte sometimes erroneously "0"
5	2534-2535	after a device clear in the internal trigger mode must the BUSY bit be "1"; this was not correct.
6	2534-2535	SRQ (service request) generation when output data is available is not reliable. In S04 this still can cause problems in internal trigger mode, speed 4, display off, help functions off.
7	2534	the IEEE interface is not in "lockout" after a LLO (Local Lock Out) command if the meter is not in the remote mode
8	2534	if NULL is pressed (300 mV dc), the first value should be displayed after approx. 3 seconds; it must be 000.0000 mV (like in the PM2535). This was not correct.
9	2534	PM2534 in remote, keyboard trigger (TRG K); when output data is asked after changing the setting, the instrument sends "999.9999+E9". This is not correct, the instrument may not send anything without a trigger command.
10	2534	behaviour of the PM2534 after a trigger via the BNC plug at the rear, during a measurement, is different from the PM2535. Triggers during a measurement must be ignored.

- 11 2434-2435 via the interface, the following non existing settings can be programmed:
- ranges 30 MΩ and 300 MΩ in Ohm-4w (PM2534)
- range 3 MΩ, speed 4
- 12 2534-2535 at single trigger or delay on, an internal digital filter was switched on; as a result, previous measurements influenced the actual measurement. With the new software the displayed value is the real measured value after the trigger or delay.
- 13 2534 software version was not displayed during the internal tests (refer to page 6-12)
- 14 2534 in speed 1 it lasts about 3 seconds before the real measurement result becomes available. After about 0.5 seconds however, a so called "partial result" is given as an pre-indication of the measured value. In SINGLE TRIGGER mode this unwanted, but in software version S02 and S03 it occurs after changing the range or function.
- 15 2534 the instrument leaves the TALK ONLY mode on pressing:
CHECK (displays t.ONLY 0) --> END (so without pressing 1).
This must be:
CHECK (t.ONLY 0) --> 1 (t.ONLY 1) --> END
- 16 2534 erroneously an ERROR indication can be given in speed 1 (e.g. OL) or in the CAL mode.
- 17 2534 the command TXT xxxxxx (display text) via the IEEE bus is not always carried out correctly.
- 18 2534 during the CAL mode it is possible to select AUTO RANGING via the interface. This is impossible in S04.
- 19 2534-2535 an erroneous calibration value in a particular function/range, causes a N C indication (not calibrated) in another range/function.
- 20 2534-2535 S04 processes input data for SYSTEM21 faster
- 21 2534 if a dump string containing CAL OFF, is sent to the meter, the STATUS byte reports erroneously a program failure.
- 22 2534-2535 different measurement results for speed 1 and speed 2 (a few counts)

- 23 2534-2535 S04 is better prepared for use of the PM2534 with an optional RS232 interface:
 - faster I/O handling via optional interface;
 slows down the IEEE interface!
 - command EMO is implemented to enable output
 of measurement data
 - for output data to printer, the meter must be
 in TALK ONLY mode.
- 24 2534-2535 the execution of long programming strings (over 30 characters) is improved in S04:
 when a program string is sent, it is interpreted after the last character has been received (was the 30th character).
 E.g. OUT_N,6 eoI. If the comma (,) is the 30th character, in S03 the command is interpreted as "only numeral results must be output". In S04 it is interpreted as "only 6 numeral results must be output".
- 25 2535 lower case characters in the argument of program data were not always allowed (e.g. OUT_s). In S04 they are allowed.
- 26 2535 in the measurement data output string, the LIMIT EXCEEDED indication L was not given. In S04 an L is given on the 6th position.
- 26 2535 if the meter is made TALK ONLY in speed 4, the keyboard is locked.
- 27 2535 erroneous display indication of ° (degree), m (milli), k (kilo), M (Mega) in the modes AX+B, dB, % and ZERO (in an activated help function). In S04 this has been omitted.
- 28 2535 if during reading the BURST BUFFER, the burst mode is switched off, the instrument sends rubbish. In S04 the instrument continues with sending normal measurement data.
- 29 2535 if the programming of AX+B or LIMIT via the keyboard is broken off, this resulted in an error in the status byte. In S04 it does not.
- 30 2535 like in the PM2534, in S04 a partial result is displayed in speed 1 (see 14)
- 31 2535 after FILTER ON or OFF, the MIN/MAX buffers are cleared in S04.
- 32 2535 in the error output string 999.9+E09 (at overload), the position of the + and the E must be interchanged. S04 outputs 999.9E+09.

33 2535 the ANALOG OUTPUT interface does not function with S02 and S03.

34 2535 the only allowed argument type for the commands DMP, MIN, MAX and TST is a question mark (?). In S02 and S03 there was no check on the argument types.

35 2534-2535 remote/local protocol for output data is for S04 implemented as follows:
 - control via IEEE controller: set multimeter addressable (tONLY 0)
 - IEEE listen only printer connected: set multimeter talk only (tONLY 1), remove other interface options.
 - analog output option: set multimeter tONLY 0
 - RS232 printer connected: set multimeter talk only (tONLY 1)
 - control via RS232 controller: set multimeter addressable (tONLY 0), remote mode (<esc>2).

Errors in S02, S03 and S04 of the PM2534 and PM2535

1. PM2534 and PM2535.

The following commands in combination with the listed selected settings will cause a "program failure" in the status byte. The commands will be correctly executed.

Command	Settings (as returned on DMP command)
MSP 1	(VDC or RTW or RFW) + CAL ON
MSP 2	(IDC or VAC or IAC or TDC) + CAL ON
FIL OFF	(VDC or IDC or RTW or RFW or TDC) + CAL ON
FIL ON	(VAC or IAC) + CAL ON
NULL OFF/ON	CAL ON or MSP 4 or not VDC 300 mV or SCL ON or DBM ON or PRC ON or ZER ON or BUR ON or SEQ ON
SCL OFF[,aaa,bbb]	CAL ON
DBM OFF[,rrr]	CAL ON
PRC OFF[,rrr]	CAL ON
ZER OFF[,rrr]	CAL ON
BUR OFF[,nnn]	CAL ON

2. PM2535

After the command SEQ ON in the calibration mode, the PM2535 recalls its stored settings, even when these settings are not allowed in the calibration mode.

3. PM2534

If in the calibration mode, the PM2534 does not give a program error in the status byte after sending the command FNC TDC via the interface. The command will be executed ($^{\circ}\text{C}$ selected), but the PM2534 does not measure.
