INSTRUCTION MANUAL MODEL 530 TYPE-ALL SYSTEM

warranty

We warrant each of our products to be free from defects in material and workmanship. Our obligation under this warranty is to repair or replace any instrument or part thereof which, within a year after shipment, proves defective upon examination. We will pay local domestic surface freight costs.

To exercise this warranty, write or call your local Keithley representative, or contact Keithley headquarters in Cleveland, Ohio. You will be given prompt assistance and shipping instructions.

repairs and calibration

Keithley Instruments maintains a complete repair and calibration service as well as a standards laboratory in Cleveland, Ohio. A service facility is also located in Los Angeles for our west coast customers.

A Keithley service facility at our Munich, Germany office is available for our customers throughout Europe. Service in the United Kingdom can be handled at our office in Reading. Additionally, Keithley representatives in most countries maintain service and calibration facilities.

To insure prompt repair or recalibration service, please contact your local field representative or Keithley headquarters directly before returning the instrument. Estimates for repairs, normal recalibrations and calibrations traceable to the National Bureau of Standards are available upon request.

```
VOLTMETER RANGE: ±1 microvolt per digit to ±1000 volts full scale
  in seven decade ranges
VOLTMETER ACCURACY: ±0.1% of reading, ±1 digit on all ranges
CURRENT SOURCE RANGE: 10<sup>-7</sup> ampere full range to 10<sup>-1</sup> ampere in
  seven decade ranges
CURRENT SOURCE ACCURACY: ±0.5% of reading, ±0.05% of full range
RANGE OF TYPING MODE: 10<sup>-3</sup> to 10<sup>4</sup> OHM-CM
 TYPING MODES: Rectification
                  Thermoelectric
PROBE CONFIGURATION REQUIRED: Four-point in-line probe
EQUIPMENT SUPPLIED:
  Keithley Model 225 Current Source
  Keithley Model 163 Digital Voltmeter
  Keithley Model 530 Type-All Switching
  Keithley Model 8201 Cable Assembly
SUPPLIED ACCESSORY:
  Model 5301 Test Lead (two pieces).
```

SECTION 1. GENERAL DESCRIPTION

1-1. GENERAL. The Keithley Model 530 Type-All System is an electronic system designed for measurement of resistivity and determination of conductivity type of a semiconductor. The Keithley System contains a precision current source, digital microvoltmeter, and other circuitry needed for resistivity and typing determinations. The Model 530 must be used with a standard four-point in-line probe to make contact to the sample.

1-2. RESISTIVITY MEASUREMENT. Resistivity of a semiconductor material can be easily determined by applying a known current through the sample. The resultant voltage drop across the sample is then measured using a sensitive microvoltmeter. However, since the resistivity is a function of slice geometry and probe spacing, several correction factors must be used. These correction factors are explained in ASTM Designation: F84-70*. The basic factors which need to be considered are:

Slice diameter	D	īnm
Average probe separation	S	mm
Specimen thickness	W	mm

NOTE: All dimensions are assumed to be in metric units unless otherwise specified.

The Keithley Model 530 System provides the convenience of selectable current so that the voltage reading can be scaled to read directly in terms of OHM-CM (where 1 mV = 1 OHM-CM). A computer program and printout (see Table 2-1) are provided in the Appendix of this Instruction Manual for calculating the proper current using BASIC language.

*Standard Method for Measuring Resistivity of Silicon Slices With A Collinear Four-Probe Array. ASTM F84-70

1-3. CONDUCTIVITY TYPE DETERMINATION. The conductivity type, or sign of the majority carrier is a fundamental property of a semiconductor sample. The Model 530 System utilizes two methods for quickly determining the semiconductor type. This system is basically described in an article entitled "Type-All System fr Determining Semiconductor Conductivity Type" from Solid State Technology/March, 1971*. The System incorporates rectification and thermoelectric typing techniques in a system that makes the two methods compatible A four-point in-line probe is used to contact the sample.

a. Rectification Mode. Rectification is the mode of operation initially used. An ac voltage is imposed across two of the probe points as shown in Figure 3d. A second set of probe points is used to sense the polarity of the generated voltage. The polarity depends on how the voltage is generated and on the conductivity type of the material. If the probe points are providing a rectification effect at the contact point to the semiconductor, then a dc voltage between points B and D will result. The polarity of the rectification depends on the conductivity type of the material. Back biasing is achieved on a metal-to-n-type semiconductor diode when the semiconductor is at a positive potential with respect to the metal. A negative potential results in a back-biased junction for p-type semicon-ductor. Thus, the semiconductor type is simply a function of the polarity of the voltage monitored by the microvoltmeter. For certain resistivities the quality of rectification degenerates such that the usefulness of this mode decreases. An acceptable rectification action occurs for voltage readings above 0.5 mV. For voltages less than 0.5 mV the thermoelectric mode should be used.

*W. A. Keenan, C. P. Schneider, C. A. Pillue, "Type-All . . .", Solid State Technology, March 1971, pg. 51-56.

b. Thermoelectric Mode. In this mode the ac voltage impressed across the input probe points increases the temperature near the point of contact by joule heating of the semiconductor. A Seebeck voltage is generated between a hot and cold probe point where &V is the voltage generated across two regions of material whose temperatures differ by AI. The physical process that generates the Seebeck voltage is the diffusion of the thermally generated carriers from the hot region of the material to the cold region. The carriers will diffuse from high-to-low-concentration regions, in particular from the hot to the cold probe. This diffusion creates a non-equilibrium carrier concentration in the cold region which generates an electric field, opposing further diffusion. This diffusion of carriers from the hot to the cold probe continues until the generated electric field is sufficient to overcome the tendency of the carriers to diffuse. For example, in p-type material, the thermally generated holes diffuse to the cold probe, building up a positive space charge which retards further diffusion. As a result, the cold probe is more positive than the hot probe. The use of four probe points permits a separation of the ac power source and the voltage-detection functions. In the Model 530 the voltage sensing is performed by the Model 163 digital voltmeter which provides speed and convenience of a digital display with automatic polarity indication. The thermoelectric mode utilizes all four probe points as shown in Figure 3e.

1

Control	Functional Description	Circuit Desig.
POWER Switch	Applies power to Model 530 System including auxiliary power receptacles.	S101
PROBE Switch	Selects either "A" or "B" probe inputs on the rear panel.	\$105
FUNCTION Switch	Selects function for resistivity or typing determination.	S103
STANDBY Position	No connections are made to probe.	
CURRENT Position	Connects current source to enable a calibration check.	
V _{FWD} Position	Connects probe to measure resistivity.	
V _{REV} Position	Connects probe to measure resistivity. (reversed polerity)	
TYPE (RECT)	Connects probe for typing using Rectification Method.	
TYPE (THERM)	Connects probe for typing using Thermal Method.	
CURRENT SHUNT Switch	Sets resistivity range.	
HI Terminal	Voltmeter High Input	J106
LO Terminal	Voltmeter Low Input	J107

TABLE 1-1. Summary of Model 530 Controls.

FIGURE 2. Rear Panel Connections.

SECTION 2 OPERATION

2-1. Resistivity Determination: The measurement of resistivity is accomplished through the use of 1) a constant current source, 2) a microvolt meter and 3) a four-point resistivity probe. Resistivity is scaled to give a direct reading in OHM-CM on a 100 mV scale (1 mV = 1 OHM-CM). Procedure:

Power. Connect the Model 530 to either 117 or 234V (Set line switch S102 to proper position). Check fuse F101 for proper rating. The Model 163 and 225 line cords should be connected to auxiliary power receptacles J104 and J105.

b. Control Settings.

1. Set the Model 225 as follows:

OUTPUT SELECTOR	 STANDBY
FILTER	 OFF
VOLTAGE COMPLIANCE	 50
Decade Switches	 0-0-0
Range	 100 µA
Power On	 ON

2. Set the Model 163 as follows:

Range		 100.0	mV
Power	On	 ON	

3. Set the Model 530 as follows:

FUNCTION	 STANDBY
PROBE	 A
CURRENT SHUNT	 1K
POWER	 ON

c. Connections.

1. Connect Model 225 output to J101 on Model 530. (Connect shorting link between LO-GND on rear panel of Model 225.)

2. Connect Model 163 terminals to J106 (Red) and J107 (Black).

Calibration. Set the Model 225 for proper curd. rent depending on the slice dimensions of the sample. Table 2-1 gives the current setting for particular slice thickness and diameter (with probe tip spacing = 1.60 MM or 0.0630 inch).

Connection Check. Connect the probe and lower е. onto slice. Set the Model 530 to CURRENT function (Position 2). Adjust the Model 530 CURRENT SHUNT Switch to give the maximum on-scale reading on the Model 163. The voltage displayed on the 163 is a function of the current x R_{SHUNT}. The Model 163 should indicate the output which has been set on the Model 225 decade dials. For example, if the current has been set to 173.1 µA, the Model 163 should indicate 173.1 mV with the Model 530 Shunt Resistor set to 1K. Since the Model 163 is scaled for direct reading of resistivity,

the reading could also be interpreted as 173.1 OHM-CM.

NOTE If the Model 163 does not indicate the proper current the probe is probably not making proper contact to the slice. If the Model 225 LIMIT lamp is lighted then the probe connections are probably open.

f. Resistivity Measurement. Set the Model 530 to VFWD function (Position 3) and record the reading on the Model 163. The display is scaled to indicate directly in terms of OHM-CM resistivity (1 mV = 1 OHM-CM). Since the resistivity measurement is dependent on slice geometry (thickness, etc.) the scaling is valid for the particular current selected from Table 2-1. If the slice dimensions are changed, a new current should be dialed out on the Model 225 to provide direct reading in OHM-CM. Set the Model 530 to VRFV function (Position 4) to obtain a reading with opposite polarity applied. The CURRENT SHUNT switch can be in any position since it does not affect the resistivity measurement.

2-2. Type Determination: The conductivity type can be determined by 1 of 2 methods: Rectification Mode or Thermoelectric Mode.

Rectification Mode. Set the Model 530 to TYPE a. (RECT) (Position 5). If the Model 163 indicates greater than 0.5 mV then the material type is determined by the polarity indicated on the Model 163. Positive Polarity = P-type Negative Polarity = N-type If the reading is less than 0.5 mV then proceed to the Thermoelectric Mode.

Thermoelectric Mode. Set the Model 530 to TYPE ь. (THERM) (Position 6). The Model 163 should indicate greater than 0.5 mV. The material type is determined by the polarity indicated on the Model 163. Positive Polarity = P-type Negative Polarity = N-type

SECTION 3. CIRCUIT DESCRIPTION

3-1. GENERAL. The Model 530 provides all the controls, interconnections, and circuits necessary for making resistivity and semiconductor typing determinations using the "Type-All" system.

3-2. EQUIPMENT USED. The Model 530 utilizes a Keithley Model 225 Current Source, a Model 160 or 163 Digital Voltmeter, and auxiliary ac power source. Separate circuit descriptions are provided in the individual Instruction Manuals for Models 163 and 225. The remaining circuits are described in the following paragraph.

3-3. SWITCHING OPERATION.

a. Standby Position. In this position the probe terminals are completely disconnected from the Model 530 circuitry.

b. Current Position. In this position the Model 163 and 225 are connected such that the Model 163 will indicate the voltage drop across one of the Shunt Resistors. For example, with the Model 225 set at 100 μ A and a 1 kilohm Shunt Resistor selected, the Model 163 should indicate 100 mV if the probe points are making satisfactory contact.

c. V_{FWD} Position. In this position the Model 163 is connected so as to read the voltage drop across the semiconductor sample. The resistivity is indicated directly in terms of OHM-CM when the current setting is scaled properly.

d. VREY Position. In this position the Model 225 polarity is reversed automatically so as to permit a reverse voltage across the sample. The Model 163 indicates the resistivity in terms of OHM-CM when the current setting is scaled properly.

e. Type (Rect) Position. In this position an ac voltage is impressed between terminals A and B. The Model 163 is connected between pins B and D.

<u>f. Type (Therm) Position</u>. In this position the Model 163 is connected between terminals C and D. The voltage which results from the Seebeck effect is measured at points separate from the impressed ac voltage points.

3-4. AC POWER SUPPLY. An ac voltage is provided by the 12.6V secondary winding of transformer T101. The primary windings are connected in parallel or in series depending on the position of the Line Switch S102. Resistor R101 provides short circuit protection for the secondary. Fuse F101 provides over-current protection for the primary of T101.

MODIFICATIONS:

The Model 160 or 163 as supplied with the Model 530 has been modified as follows:

Resistors R112 and R115 have been removed to increase the input resistance of the voltmeter on the 100 mV range.

Note: If the Model 160 is supplied the ohms function will not be useable on the 1 megohm and 10 megohm ranges unless the resistors (R112 and R115) are replaced.

CN 530-3 Applies to Manual Printed October, 1974.

KEITHLEY INSTRUMENTS, INC.

INSTRUCTION MANUAL CHANGE NOTICE MODEL 530 TYPE-ALL SYSTEM

INTRODUCTION: Since Keithley Instruments is continually improving product performance and reliability, it is often necessary to make changes to Instruction Manuals to reflect these improvements. Also, errors in Instruction Manuals occasionally occur that require changes. Sometimes, due to printing lead time and shipping requirements, we can't get these changes immediately into printed Manuals. The following new change information is supplied as a supplement to this Manual in order to provide the user with the latest improvements and corrections in the shortest possible time. Many users will transfer this change information directly to a Manual to minimize user error. All changes or additions are indicated in *italice*.

CHANGES

PAGE 5 - Paragraph 2-2

b. Thermoelectric Mode. Set the Model 530 to TYPE (THERM) (Position 6). The Model 163 should indicate *less* than 0.5 mV.
