WARNING

1. The following instructions are for use by qualified personnel only. To avoid electric shock, do not perform servicing other than contained in the operating instructions unless you are qualified to do so.
2. High voltage up to 6000 volts dc is present when the oscilloscope is operating. Line voltage (100 to 240 VAC) is present on the power transformer, on-off switch, fuse holder, and line voltage selector any time the oscilloscope is connected to an ac power source, even if turned off. Always observe caution when the housing is removed from the unit. Contacting exposed high voltage could result in fatal electric shock.

SPECIFICATIONS

CRT	: 150QTM31	Sweep Time	: 0.2 μ s/div to 0.5 s/div \pm 3%, in 20 ranges, in 1-2-5 sequence.
Acceleration Voltage	: 6 kV	Vernier control provides fully adjustable sweep time between steps.	
Display Area	: 8 \times 10 div (1 div = 10 mm)	Sweep Magnification	: \times 10 (ten times) \pm 5% (0.2 μ s/div range; \pm 8%)
Type	: Rectangular, with internal graticule	Linearity	: \pm 3% all ranges, \pm 5% on 0.2 μ s/div range at \times 10 magnification.
VERTICAL AXIS	: CH1 and CH2	TRIGGERING	
Sensitivity	: 1 mV/div to 5 V/div, \pm 3%	Internal Sync	V. MODE; Triggered by input signal selected by vertical MODE setting.
Attenuator	: 12 steps, 1 mV/div to 5 V/div in 1-2-5 sequence.	CH1; Triggered by CH1 signal	
	Vernier control for fully adjustable sensitivity between steps.	CH2; Triggered by CH2 signal	
Input Impedance	: 1 M Ω \pm 2%, approx. 22pF	LINE; Triggered by line frequency	
Frequency Response		External Sync	EXT; Triggeered by signal applied to EXT TRIG INPUT jack
5 mV/div to 5 V/div	: DC; DC to 20 MHz, -3 dB	External sync Input Impedance	: approx. 1 M Ω \pm 20% approx. 30pF
	AC; 5 Hz to 20 MHz, -3 dB	Maximum External Trigger Voltage	: 50 V (DC + AC peak)
1 mV/div, 2 mV/div	: DC; DC to 10 MHz, -3 dB	Coupling	: AC, TV FRAME, TV LINE
	AC; 5 Hz to 10 MHz, -3 dB	Trigger Sensitivity	
Rise Time	: 17.5 nsec or less (20 MHz)		
	35 nsec or less (10 MHz)		
Crosstalk	: -40 dB minimum		
Operating Modes	: CH1; single trace		
	CH2; single trace		
	ALT; two waveforms alternating		
	CHOP; two waveforms chopped		
	ADD; CH1 + CH2 added display		
Chop Frequency	: Approx. 250 kHz		
Channel Polarity	: Normal or inverted, Channel 2 only inverted		
Δ Maximum Input voltage	: 500 Vp-p or 250 V (DC + AC peak)	PROBE ADJ., VOLTAGE	: 1 V \pm 3%, square wave, positive polarity, approx. 1 kHz
HORIZONTAL AXIS	: (input thru CH2, \times 10 MAG not included)	INTENSITY MODULATION	
Operating Mode	: With TRIG MODE switch, X-Y operation is selectable.	Sensitivity	: TTL compatible
	CH1; Y axis		Positive voltage decreases brightness.
	CH2; X axis		Negative voltage increases brightness.
Sensitivity	: Same as vertical axis (CH2)	Input Impedance	: Approx. 10 k Ω
Input Impedance	: Same as vertical axis (CH2)	Usable Frequency Range	: DC to 2 MHz
Frequency Response	: DC; DC to 500 kHz, -3 dB	Maximum Input Voltage	: 50 V (DC + AC peak)
	AC; 5 Hz to 500 kHz, -3 dB	VERTICAL AXIS SIGNAL OUTPUT:	
X-Y Phase Difference	: 3° or less at 50 kHz	(CH1 SIGNAL OUTPUT)	
Δ Maximum Input Voltage	: Same as vertical axis (CH2)	Output Voltage	: Approx. 50mV/div (50 Ω load)
SWEEP		Output Impedance	: Approx. 50 Ω
Type	NORM : Triggering sweep	Frequency Response	: 100 Hz to 20 MHz, -3 dB
	AUTO : Sweep free runs in absence of trigger	TRACE ROTATION	: Electrical, adjustable from front panel

SPECIFICATIONS

POWER REQUIREMENT

Power Supply	: AC 100 V/120 V/220 V/240 V ±10%
Line Frequency	: 50/60 Hz
Power Consumption	: Approx. 35 W
DIMENSIONS (W×H×D×)	: 319 (341)×132 (145)×380 (442) () dimensions include progru- sion from basic outline dimensions
WEIGHT	: Approx. kg

ENVIRONMENT

Operating Temperature and Humidity for Guar- anteed Specifications	: 10°C to 35°C, 85% maximum RH
Full Operating Tempe- rature and Humidity	: 0°C to 40°C, 85% maximum RH

SAFETY

SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. The specified voltage is shown at the left side of the power cord on the rear panel. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the oscilloscope at earth ground. Do not attempt to defeat the ground wire connection or float the oscilloscope; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

The optional power cords are shown as follows in Fig. 4.

Line fuse

The fuse holder is located on the rear panel and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

Voltage conversion

This oscilloscope may be operated from either a 100 V to 240 V, 50/60 Hz power source. Use the following pro-

cедure to change from 100- to 240 volt operation or vice versa.

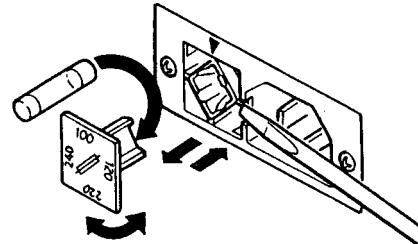

Replacing the fuse

In case the fuse has blown, locate the cause. If the fuse itself is the cause, replace it as follows:

1. Pull the plug of the power cord from the power outlet.
2. Remove the fuse holder in the rear panel using a standard screwdriver.
3. Take out the blown fuse, and in its place, insert a new fuse.
4. Set the label of your line voltage to the mark ▼, then plug the fuse holder containing the new fuse into the rear panel.

Changing the supply voltage

Remove the fuse holder in the rear panel using a standard screwdriver. Then set the label of your line voltage to the mark ▼ and plug the fuse holder back into place. When changing the supply setting from 100/200 V to 220/240 V, change the 0.5 A fuse for a 0.3 A one.

Fig. 3 Power Input Voltage Configuration

CIRCUIT DESCRIPTION

Vertical Attenuator Circuit (X73-1640-00)

The attenuators of CH1 and CH2 incorporate a unit encompassing the entire attenuator circuit.

The vertical signals input from the BNC connectors are switched by the AC-DC-GND switch, supplied through the 1/1, 1/10 or 100/1 attenuator, and input to the first-stage buffer amplifier.

The first-stage buffer amplifier consists of Q1 to Q6 and U1 (CH2: Q21 to Q26, U3). The signal which enters the buffer amp is separated into high-frequency and low-frequency components. The high-frequency component is impedance-converted by Q3 (Q23), and the low-frequency component by U1 (U3). The respective components are recombined at Q4 (Q24) and output from the emitter-follower of Q5 (Q25). Q4 (Q24) and Q6 (Q26) provided with the same forms as Q3 (Q23) and Q5 (Q25) in order to reduce the DC offset drift. The buffer amplifier is designed in consideration of the temperature drift by selecting a device with a small temperature drift as U1 (U3) and by applying negative feedback. The signal output from the buffer amplifier is once again input to the second-stage attenuator of the attenuator unit, where it is attenuated to 1/1, 1/2 or 1/5 and supplied to the vertical preamplifier. The second-stage attenuator consists of a low-impedance resistor network with good frequency characteristics, and is provided with a switch for boosting the preamplifier gain 5-fold when the deflection factor is 1 mV/div or 2 mV/div. Q1 (Q21) and Q2 (Q22) are provided for the input circuitry so that they can function equivalently as diodes in order to prevent devices when the input has a large amplitude.

VR1 (VR10) is used for adjusting the DC balance between attenuator steps and can be adjusted from outside the case. VR2 (VR11) is used for adjusting the gain of the low-frequency component.

Vertical Preamplifier Circuit (X73-1640-00)

The signal output from the attenuator circuit enters the second amplifier which consists of transistor array U2 (U4). This stage is a differential amplifier, which generates complementary signals, amplifies and supplies them to the third amplifier. When the deflection factor is 1 mV/div or 2 mV/div, the emitter resistance of U2 a, b (U4a, b) can be switched by the switch in the second-stage attenuator to boost the gain 5-fold. VR4 (VR13) is used for adjusting the DC offset at this time, and can be adjusted from the outside. TC1 (TC3), TC2 (TC4) and VR3 (VR12) form a circuit which adjusts the frequency characteristic, and VR26 (VR27) is used for adjusting the deflection factor to 1 mV/div or 2 mV/div.

Thermistor TH1 (TH2) is used to compensate for the gain drift due to temperature when the deflection factor is 1 mV/div or 2 mV/div.

The signal amplifier by the second amplifier is further amplified by the cascode amplifier of U2 c, d (U4 c, d), Q7 (Q28) and Q8 (Q29). This third amplifier has a large gain therefore uses the cascode-connected structure in order to suppress the influence from the transistor's feedback capacity.

With CH2, Q27 and Q30 from the CH2 INV Circuit. Q28 and Q29 can be switched to Q27 and Q30 by the switch provided with CH2 POSITION VR.

U2e (U4e) is the regulated power supply or the third amplifier provided for improving the CMRR of the differential amplifier.

Between the second and third amplifier, the vertical deflection factor variation circuit is formed using the VR on the attenuator unit. VR6 (VR15) is used for the balance adjustment in this operation, and can be adjusted from the outside.

VR25 (VR16) is used for the balance adjustment of the third amplifier. VR25 is the CH1 POSITION adjustment control and VR16 is the CH2 INV balance adjustment control.

The signal amplified by the third amplifier is sent to the fourth amplifier via the emitter-follower of Q9 (Q31) and Q10 (Q32). D3 (D12) and D4 (D13) are used for limiting the amplitude of the signal.

The fourth amplifier is also a cascode amplifier, composed of Q11 (Q33), Q12 (Q34), Q16 (Q38) and Q17 (Q39). The vertical mode is switched at this stage by switching Q16 (Q38), Q17 (Q39), D5 (D14) and D6 (D15) using the vertical mode switching signal from the horizontal sweep unit. VR23 and VR24 are used to vary the differential amplifier current respectively as CH1 POSITION and CH2 POSITION.

Q13 and Q14 pick up signal from the fourth amplifier, and Q13 and Q46 send a current signal to the horizontal sweep unit for use as the CH1 trigger signal. Q14 picks up the CH1 OUT signal, which is supplied through the emitter-follower of Q18 and output from the push-pull single-ended amplifier of Q19 and Q20. Q15 is the regulated power supply for Q13 and Q14, and generates the operation current for the CH1 trigger current signal. D7 is used for the temperature compensation of the power supply.

VR7 is used to adjust the CH1 gain, and VR8 adjusts the gain of the CH1 trigger and CH1 OUT signals. VR9 is used to align the DC level of the CH1 trigger signal with that of the CH2 trigger signal.

Q35 and Q36 pick up the signal from CH2 of the fourth amplifier, Q35 and Q47 sends the power supply signal to the horizontal sweep unit for use as the CH2 trigger signal, and Q36 sends the same signal to the same unit for use as the X signal. Q37 is the regulated power supply for Q35 and Q36, and generates the operation current for the CH2 trigger and X current signals. D16 is used for the temperature compensation of the power supply.

VR17 is used to adjust the CH2 gain, and VR18 adjusts the

CIRCUIT DESCRIPTION

gain of the CH2 trigger and X signals. VR19 adjusts the DC level of the signal by adjusting the position of X.

TC7 is the trimmer which adjusts the CH2 frequency characteristic.

D20 is used for switching of the X-Y mode and sweep.

Vertical Output amplifier Circuit (X73-1640-00)

The signal switched by the fourth amplifier of the vertical preamplifier circuit is mixed at the collectors of Q16, Q17, Q38 and Q39. Sent through the emitter-follower of Q40 and Q41, and amplified by the output amplifier consisting of Q42, Q43, Q44 and Q45 to be used to drive the CRT's Y deflection plate.

The output amplifier is cascode-connected in order to suppress the influence from the transistor's feedback capacity and to offer high withstand voltage and high fT. To maintain the amplifier's operating point at a constant level, non-adjusting circuit is achieved by the feedback using U5a and D17.

TH3 is used to compensate for the temperature drift of the gain of all stages of the vertical amplifier.

VR2 is used for adjusting the balance of +Y and -Y of the CRT. It adjusts so that the trace comes to the center position. VR21, VR22, TC5 and TC6 form a circuit which adjusts the frequency characteristic.

Vertical Mode Logic Circuit (X74-1430-00)

The vertical mode switching signal from the vertical amplifier unit and the signal from the sweep gate are input to the vertical mode logic circuit. The vertical mode switching signal controls the flip-flop consisting of D2, D3 and U2a and the chop signal generator consisting of U1c, U1d and D1, while the signal from the sweep gate controls the flip-flop via U1a and U1b. The flip-flop outputs the channel switching signal for the vertical axis, and sends it to the vertical amplifier unit via D6 and D8. Also in the X-Y mode, the flip-flop is controlled via D4, D5 and D7.

Trigger Signal Generator Circuit (X74-1430-00)

A total of four signals, i.e. the CH1 and CH2 trigger signals from the vertical amplifier unit, the signal from the external trigger amplifier and the line trigger signal, are switched by diodes D10 to D13 and trigger-source switch S1 a, b, c, and d. The selected signal is amplified by grounded-base amplifier Q4, supplied through the emitterfollower of Q5 and Q6, and amplified by the differential amplifier of Q7 and Q8. The amplified signal is sent to the coupling select switch after its polarity has been selected by the trigger slope switch.

On the other hand, in the TV trigger mode, the signal is extracted from the emitter of Q5, supplied through the coupling switch to Q11, where a signal with complementary polarity is generated. One of the two signals, which is

selected by the trigger slope switch, is sent to the amplifier of Q12, Q13 and Q14, which amplifies only the TV signal trigger pulse. The amplified TV trigger pulse is then filtered to be separated into the vertical and horizontal trigger pulses, and they are both supplied to the coupling switch.

The coupling switch is supplied with the normal trigger signal vertical TV trigger signal and horizontal TV trigger signal. The signal selected is amplified by the final stage of trigger amplifier, Q9 and Q10, before being output.

The trigger signal from the trigger amplifier's final stage is shaped the schmitt trigger circuit Of U3c, its level and polarity are converted by Q15, and the signal obtained is output as the sweep gate clock signal.

The trigger signal, the waveform of which has been shaped, is also supplied to the differentiation circuit and input to the auto free-run circuit consisting of U3a, U3b, U3c and Q16. This circuit detects the presence or absence of the output from U3c, and controls the sweep gate so that free-run occurs when there is no signal in the AUTO mode. The external trigger signal is input via the trigger amplifier consisting of Q37 and Q38. The impedance of the external input is converted by Q37 and amplified by Q38, so the trigger signal is output as a current signal.

The line trigger amplifier consists of Q24. It amplifies the line signal, which has been wave-shaped by the power supply high-voltage unit, and outputs it as a current signal.

Horizontal Sweep Circuit (X74-1430-00)

The output from sweep gate U2b is determined by the auto free-run circuit and schmitt trigger circuit. When Q23 is turned OFF via Q3 and Q22, the Miller integrator circuit starts charging at a speed determined by the CR timebase circuit. The sweep rate is variable using SWEEP VARIABLE VR1.

The sweep stopper circuit consisting of Q19 and Q20 detects the voltage output from the Miller integrator circuit, inverts the statuses at U4b, c and d, and controls the sweep gate via D24 and U4a so as to stop sweeping. At the same time, it also controls the holdoff circuit, turning Q21 OFF and charging the holdoff capacitor. The voltage output from it is detected and returned to U4c again. Its status is then inverted and used to control the sweep gate so as to start sweeping.

The sawtooth wave output from the Miller integrator circuit is sent to the horizontal output amplifier after its sweep rate has been adjusted by VR2. VR10 is used for adjusting the horizontal position of the trace.

VR3 and TC1 are used for adjusting the sweep time of the 10 μ s/div and 10 μ s/div ranges respectively.

Horizontal Amplifier Circuit (X74-1430-00)

The sawtooth wave signal is input to the emitter of Q25 as a current signal, and it is converted into a voltage. The horizontal position is obtained similarly by supplying DC

CIRCUIT DESCRIPTION

current to the emitter. The signal output from Q25 is sent via the emitter-follower of Q26, input to the differential amplifier of Q27 and Q28, and sent to the final stage via the emitter-follower consisting of Q30 and Q31. Q33 and Q35 are the constant-current loads for Q32 and Q34 respectively. After the negative feedback, the output with the better linearity is used to drive the CRT's C deflection plate at low impedance.

Q29 is the constant-current supply for biasing Q17 and Q28, and is temperature-compensated by D21. D28 and D29 are employed to present the delay in response due to the switching operation of Q32 and Q34.

TH2 is used for compensating the temperature drift of the horizontal amplifier gain, and TH1 is used for correcting the temperature drift of the gain in X10 MAG mode. X10 MAG refers to the magnification of gain by 10-fold, made possible by varying the gain resistance between the emitters of Q27 and Q28.

VR5 is used for adjusting the X10 MAG gain, and VR4 is for adjusting the position center in X10 MAG mode.

Blanking Circuit (X74-1430-00)

Q, the output from sweep gate U2b, and the CHOP signal obtained by U1c and d are ANDed at U1a to obtain the blanking signal. After its amplitude is varied at Q17 and Q18 by the voltage from the INTENSITY VR, it is sent to the power-supply high-voltage unit.

X-Y Circuit (X74-1430-00)

To prevent sweeping in the X-Y mode, the sweep gate is controlled from the mode switch via D18. The CHOP signal oscillator is stopped via D4, the vertical mode logic is controlled by D5 and D7 so that CH1 is ON and CH2 is OFF, and the blanking signal is generated by D17. In addition, the sawtooth wave signal is switched to the X signal from the vertical amplifier unit, and the current signal is supplied to the horizontal amplifier circuit.

CRT G₂ Bias Circuit and ASTIG Circuit (X74-1430-00)

As the CRT's G₂ bias voltage has a large influence on its sensitivity and intensity, it is stabilized by Q36 and output at low impedance.

With the ASTIG circuit, +120 V is adjusted by a VR and connected directly to the CRT's second plate.

Blanking Amplifier Circuit and High Voltage Circuit (X68-1450-00)

The high voltage used for driving the CRT is obtained using a DC-DC converter circuit.

By the oscillation with the non-regulated +10 V power supply, Q3 and T1, the secondary coil of T1 outputs the CRT heater power and the AC power supply for the CRT

cathode and anode. The power for the cathode and anode are rectified by the rectifier block which is filled with epoxy resin.

The high-voltage cathode power supply is double-voltage rectified, high-voltage anode power supply is rectified to 6 times, and -1.5 kV and 4.5 kV high voltages are obtained respectively. For this purpose, the converter is designed to be a safe circuit without high-voltage leakage, having high efficiency and low current consumption.

The converter is also made highly stable thanks to the feedback applied using operational amplifier U4b.

For the blanking amplifier circuit, the blanking signal from the horizontal sweep unit is supplied to Q10 via the emitter-follower of Q13. Q9 is the constant-voltage load of Q10. It is subject to negative feedback so it amplifies and outputs the signal with low output impedance.

This blanking signal is DC-regenerated by the carrier signal from D14 to D17 and T1 to obtain a high voltage used for driving the CRT grid No. 1.

The focusing high voltage is obtained by dividing the cathode high voltage using a resistor with potentiometer, and applied to the first plate.

The external intensity modulation circuit is a simplified circuit, in which the input signal is supplied via a resistor to the base of Q13 of the blanking amplifier. The input voltage is +5 V, and the intensity decreases when the voltage increases positively.

VR2 is the intensity adjustment control.

Power Supply Circuit (X68-1450-00)

The constant-voltage regulated power supply circuit is designed to be highly stable by using operational amplifiers U1a, U1b, U2b, U3a and U3b as the error amplifiers of all of five lines. Q1 to Q7 are the control transistors. VR1 is used to adjust -10 V, which is the reference voltage of all error amplifiers.

Calibration Voltage Generator Circuit (X68-1450-00)

This is an oscillation circuit using operational amplifier U2a and outputs a highly stable signal. VR3 is used to adjust the amplitude of the calibration voltage output.

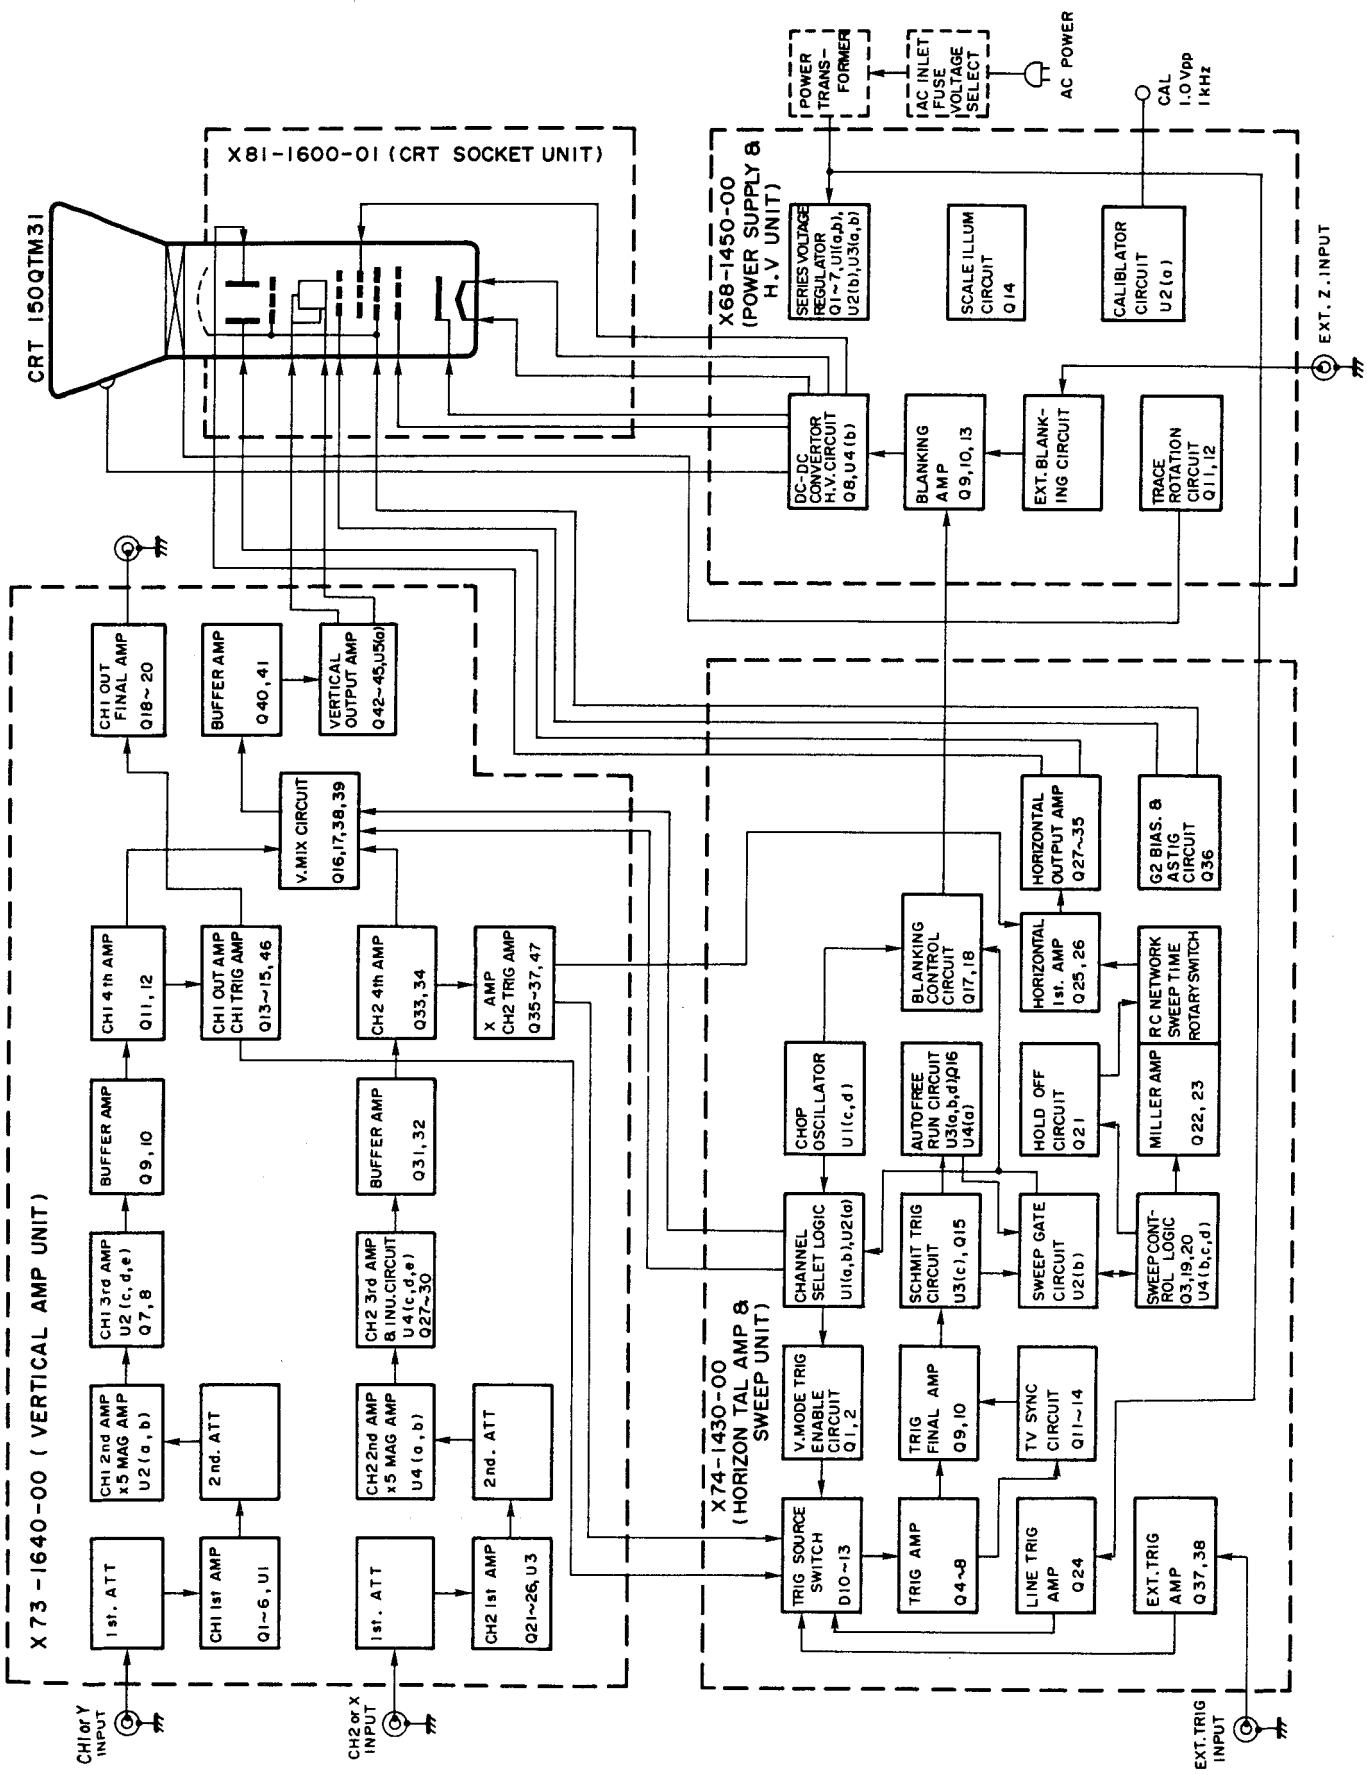

Trace Rotation Circuit (X68-1450-00)

Q11 and Q12 supply current to the rotator coil.

Scale Illumination Circuit (X68-1450-00)

The power is supplied via an independent line deriving from the ±10 V coil of the power transformer. The voltage is rectified by diode bridge D22 and supplied to the illumination lamp via a VR and control transistor Q14.

BLOCK DIAGRAM

ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.

The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available, contact your dealer. For optimum adjustment, turn the power on and warm up the this equipment sufficiently (more than 30 minutes) before starting.

Before calibrating the unit, check the power supply voltage.

TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustment.

Test Equipment	Model	Minimum Specification
Digital Multi-Meter	DL-706 (KENWOOD)	Impedance: More than 10 MΩ, Measuring range: 0.01 V to 199 V
Sine-Wave Generator	651 B (YHP)	Frequency: 10 Hz to 10 MHz, constant voltage over tuning range
Sine-Wave Generator	SG-503 (Tektronix)	Frequency: 50 kHz to 100 MHz, Output impedance: 50 Ω, constant voltage over tuning range.
Square-Wave Generator	PG-506 (Tektronix)	Output signal: 1 kHz, Amplitude: 5 mVp-p to 5 Vp-p, Accuracy: within ±1%, Rise time: 35ns or less 1 MHz, Rise time: 1 ns or less
Q Meter	4343B (YHP)	—
Color Pattern Generator	CG-911A (KENWOOD)	—
Oscilloscope	CS-2110A (KENWOOD)	Sensitivity: more than 5 mV Frequency response: More than 100 MHz
Time-Marker Generator	TG-501 (Tektronix)	Time mark: 0.5 s to 0.1 μs repetitive waveform
High-Voltage Probe	—	Input Impedance: 1000 MΩ
Termination	—	Impedance: 50 Ω Accuracy: within 3%
Termination	—	3 watts type impedance: 50 Ω
Attenuator	—	—20 dB attenuation (50 Ω)

PREPARATION FOR ADJUSTMENT

Control Setting

The control setting listed below must be used for each adjustment procedure.

Exceptions to these settings will be noted as they occur.

After completing a adjustment, return the controls to the following settings.

NAME OF KNOBS	POSITION
INTENSITY	3 o'clock
FOCUS	Optimum position
CH1, CH2 POSITION	Mechanical center
◀ ▶ H. POSITION/PULL × 10MAG	Mechanical center, push CAL

TRACE ROTATION	AC-GND-DC; GND	—	TRACE ROTATION VR		Trace is in parallel with horizontal graduation.
CAL. ADJ.		CS 2110	VR3	X68	Input the Calibration voltage into CS-2110, the amplitude should be 1 Vp-p±2.5%.
VERTICAL AMPLIFIER SECTION ADJ. (1)					
CRT CENTER		—	VR20	X73	Short the short terminal (TP1). Trace should be in the CRT center.
CH1 ATT STEP BAL.	VOLTS/DIV; 10 mV AC-GND-DC; GND	—	VR1	X73	Trace does not move vertically when rotating CH1 variable control.
	VOLTS/DIV; 1 mV AC-GND-DC; GND	—	VR4		
CH1 DC BAL	VOLTS/DIV; 1 mV AC-GND-DC; GND	—	VR6	X73	Trace does not move vertically when rotating CH1 variable control.
CH2 ATT STEP BAL.	VOLTS/DIV; 10 mV AC-GND-DC; GND	—	VR10	X73	Trace does not move vertically when rotating CH2 variable control.
	VOLTS/DIV; 1 mV AC-GND-DC; GND	—	VR13		
CH2 DC BAL	VOLTS/DIV; 1 mV AC-GND-DC; GND	—	VR15	X73	Trace does not move vertically when rotating CH2 variable control.
CH2 INVERT	MODE; CH2 VOLTS/DIV; 1 mV AC-GND-DC; GND	—	VR16	X73	Trace should be overlapped in the center of the graduation.
CH1 POSITION	MODE; CH1 AC-GND-DC; GND	—	VR25	X73	Set the CH1 position control to its mechanical center. Trace should be in the CRT center.
CH1 100 Hz SQUARE WAVE COMP.	MODE; CH1 VOLTS/DIV; 10 mV	PG 506	VR2	X73	Apply a 100 Hz square wave signal to display a waveform of 6 division vertical amplitude. Adjust for the best flat-top waveform.
CH2 100 Hz SQUARE WAVE COMP.	MODE; CH2 VOLTS/DIV; 10 mV	PG 506	VR11	X73	Same as CH1.
CH1 GAIN	MODE; CH1 VOLTS/DIV; 5 mV	PG 506	VR7	X73	When applying a 1 kHz, 20 mVp-p square wave signal, vertical amplitude should be 4 div.
	MODE; CH1 VOLTS/DIV; 1 mV	PG 506	VR26	X73	When applying a 1 kHz, 5 mVp-p square wave signal, vertical amplitude should be 5 div.

ADJUSTMENT

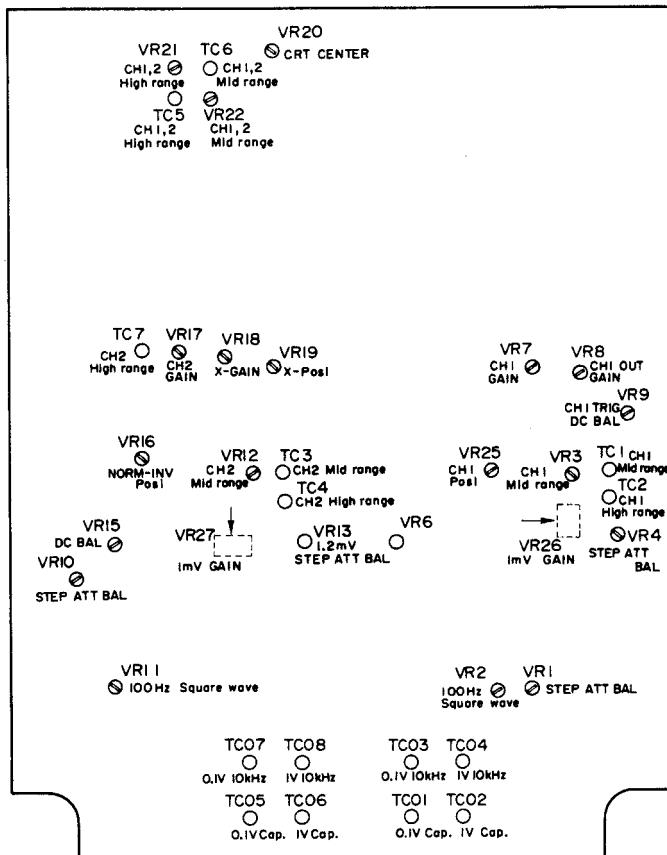

Item	Control setting	Test equ.	Adjustment control	P.C.B	Procedure
CH2 GAIN	MODE; CH2 VOLTS/DIV; 5 mV	PG 506	VR17	X73	When applying a 1 kHz, 20 mVp-p square wave signal, vertical amplitude should be 4 div.
	MODE; CH2 VOLTS/DIV; 1 mV	PG 506	VR27	X73	When applying a 1 kHz. 5 mVp-p square wave signal, vertical amplitude should be 5 div.
CH1 OUTPUT	MODE; CH1	SG 503 CS 2110	VR8	X73	Connect the CH1 OUTPUT connector to channel 1 of test oscilloscope through a 50 ohm BNC cable. Set test oscilloscope; CH1 VOLTS/DIV for 50 mV position. Applying a 50 kHz sine wave for 6 div on the CRT screen, display a 5 divisions vertical amplitude on the test oscilloscope.
X GAIN	TRIG MODE; X-Y VOLTS/DIV; 10 mV (CH2)	PG 506	VR18	X73	When applying a 1 kHz, 50 mVp-p square wave signal, horizontal amplitude should be 5 div.
HORIZONTAL AMPLIFIER AND SWEEP SECTION ADJ.					
1 ms SWEEP TIME	SWEEP TIME/DIV; 1 ms	TG 501	VR2	X74	Pulse should be on each division on the graduation line.
10 ms SWEEP TIME	SWEEP TIME/DIV; 10 ms	TG 501	VR3	X74	11th pulse should correspond to the right end of the graduation line.
10 μ s SWEEP TIME	SWEEP TIME/DIV; 10 μ s	TG 501	TC1	X74	11th pulse should correspond to the right end of the graduation line.
H. POSITION	TRIG MODE; AUTO SWEEP TIME/DIV; 1 ms	—	VR10	X74	Set H. POSITION control to its mechanical center. The left end of trace should correspond to the left end of the graduation line.
MAG GAIN	SWEEP TIME/DIV; 1 ms PULL \times 10MAG; PULL	TG 501	VR5	X74	Interval of pulses should be 10 div when applying a 1 ms time marker signal.
MAG CENTER	SWEEP TIME/DIV; 1 ms PULL \times 10 MAG; PUSH	TG 501	VR4	X74	The center of pulse should be center of the graduation scale when applying a 5 ms time marker signal. H. POSITION...mechanical center.
X POSITION	TRIG MODE; AUTO \Rightarrow X-Y AC-GND-DC; GND	—	VR19	X73	Adjust the left end of trace for the left end of the graduation line. When switching the TRIG MODE switch to X-Y position, spot should be the center of the screen.
VERT MODE TRIG OFFSET	TRIG SOURCE; VERT MODE MODE; ALT	SG 503	VR9	X73	When applying a 50 kHz, 8 div sine wave signal. CH1 trace should correspond to CH2 trace.

ADJUSTMENT

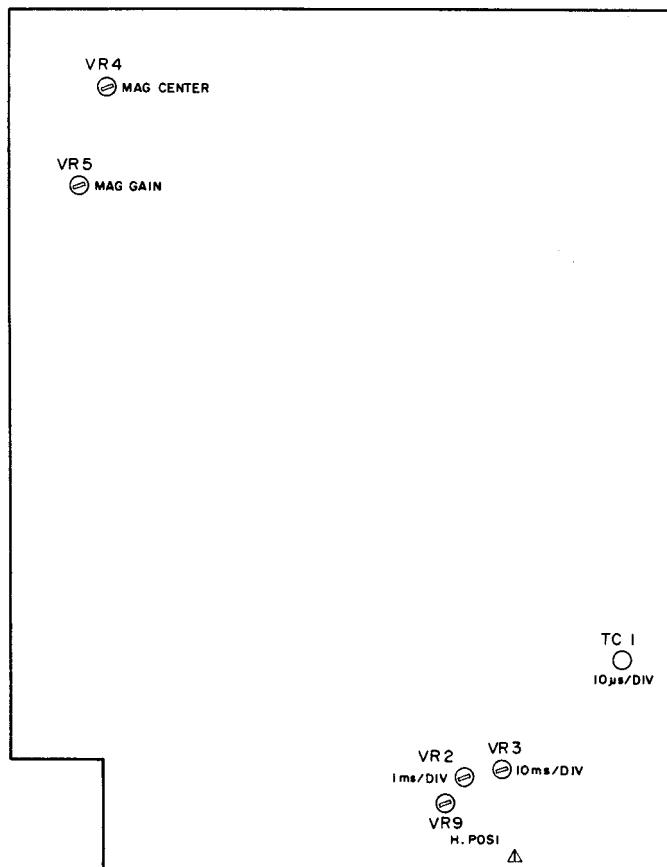

Item	Control setting	Test equ.	Adjustment control	P.C.B	Procedure
VERTICAL AMPLIFIER SECTION ADJ. (2)					
CH1 WAVE SHAPE		PG 506	TC03 TC04	X73	Same as 10 mV range, a best flat top waveform should be obtained. TC03...0.1 V TC04...1 V
CH2 WAVE SHAPE		PG 506	TC07 TC08	X73	Same as 10 mV range, a best flat top waveform should be obtained. TC07...0.1 V TC08...1 V
CH1 INPUT CAPACITY		4343B	TC01 TC02	X73	Same as 10 mV range. Input capacity should be $22 \text{ pF} \pm 3 \text{ pF}$. TC01...0.1 V TC02...1 V
CH2 INPUT CAPACITY		4343B	TC05 TC06	X73	Same as 10 mV range. Input capacity should be $22 \text{ pF} \pm 3 \text{ pF}$. TC05...0.1 V TC06...1 V
CH1 OVERSHOOT	SWEEP TIME/DIV; 0.2 μs VOLTS/DIV; 10 mV	PG 506	TC6, VR22, TC1, VR3 TC5, VR21, TC2	X73	When applying a 1 MHz, square wave signal, vertical amplitude should be 6 div. Set TC2 at mechanical center, for the sharpest waveform. TC6, VR22, TC1, VR3...mid range flat top waveform TC5, VR21...high range flat top waveform Set VOLTS/DIV to 10 mV for 6 div $\pm 3\%$ vertical amplitude waveform. Overshoot should be $\pm 3\%$.
CH2 OVERSHOOT	SWEEP TIME/DIV; 0.2 μs VOLTS/DIV; 10 mV	PG 506	TC3, VR12 TC4, TC7	X73	When applying a 1 MHz square wave signal for 6 div vertical amplitude. TC3, VR12...mid range flat top waveform TC4...high range flat top waveform TC7...peak top waveform. Overshoot should be $\pm 3\%$.
