NOTE

The detailed description on "Circuit descriptions" — Cascode, Constant current, and ASO circuitry — is written in the L-07M and the KA-8100 service manual.

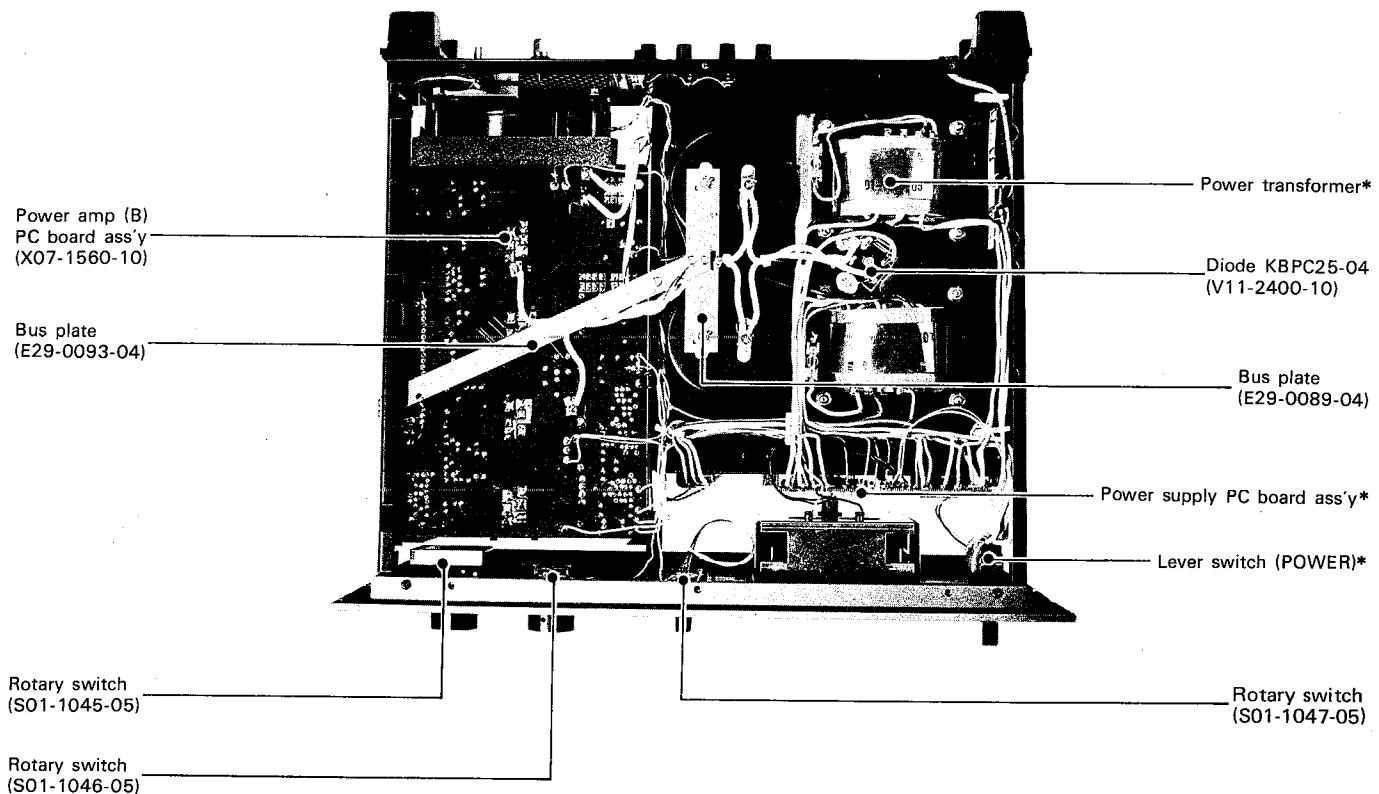

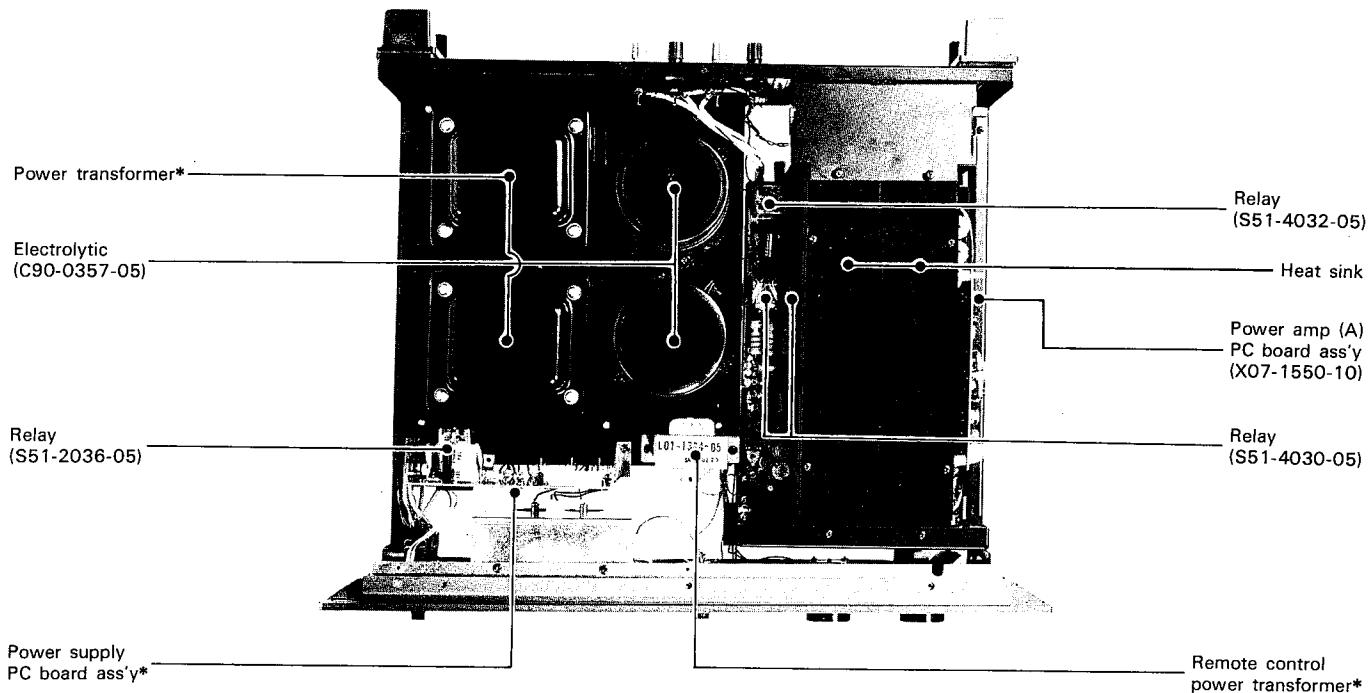

DC POWER AMPLIFIER

EXTERNAL VIEW

* Refer to Destinations' Parts List.

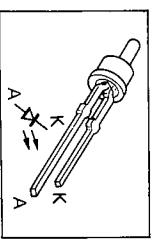

INTERNAL VIEW

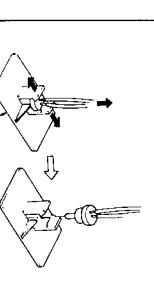

* Refer to Destinations' Parts List.

DISASSEMBLY FOR REPAIR

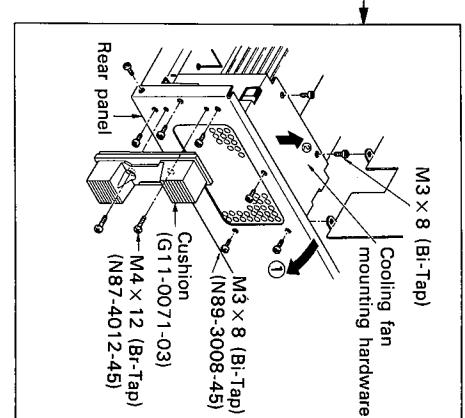

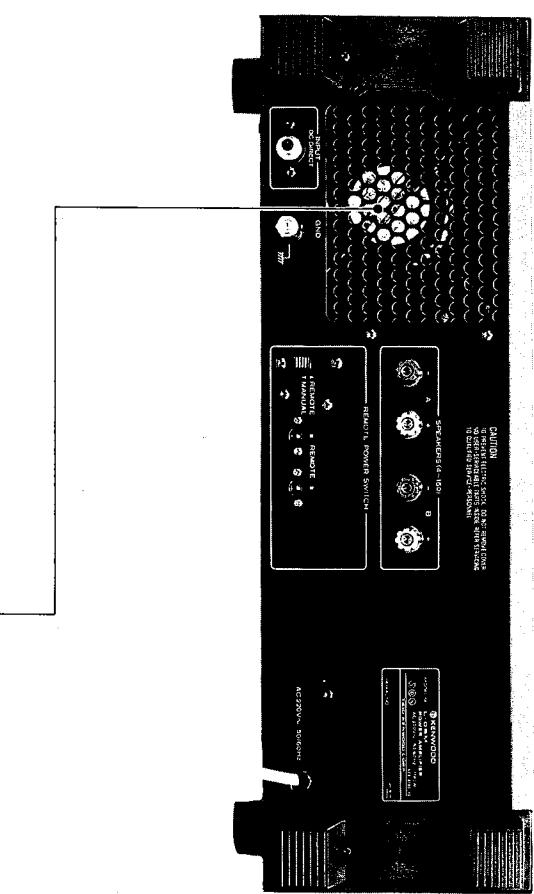

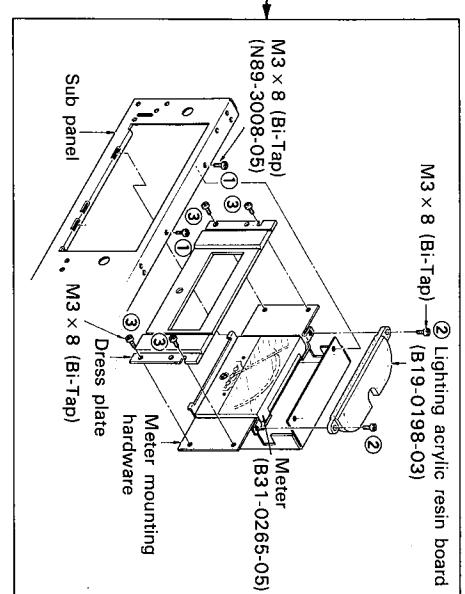

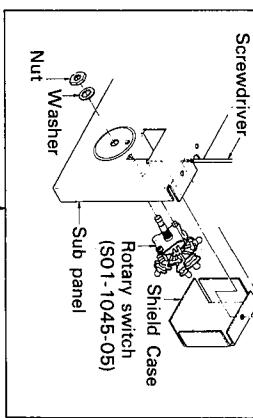

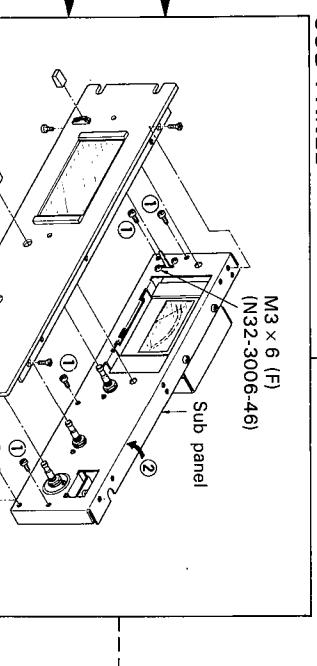

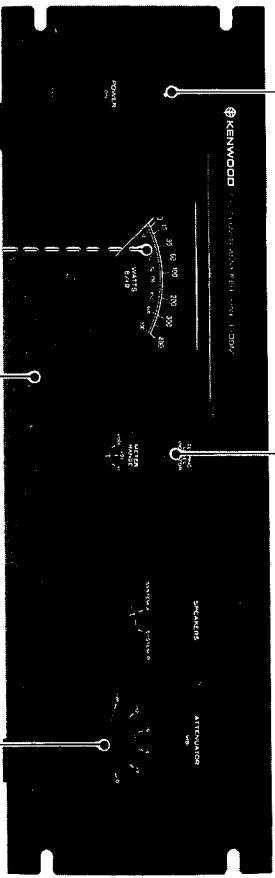

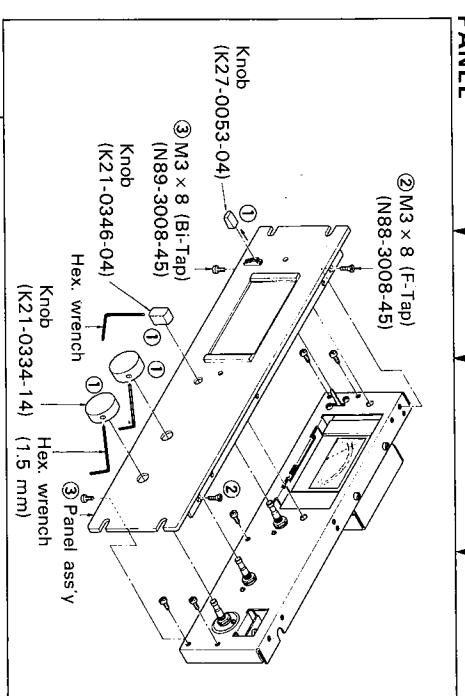

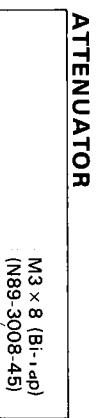

Pull out the LEDs from the LED holders after removing the front panel.

Because LED has two polarity, positive and negative should be connected correctly.

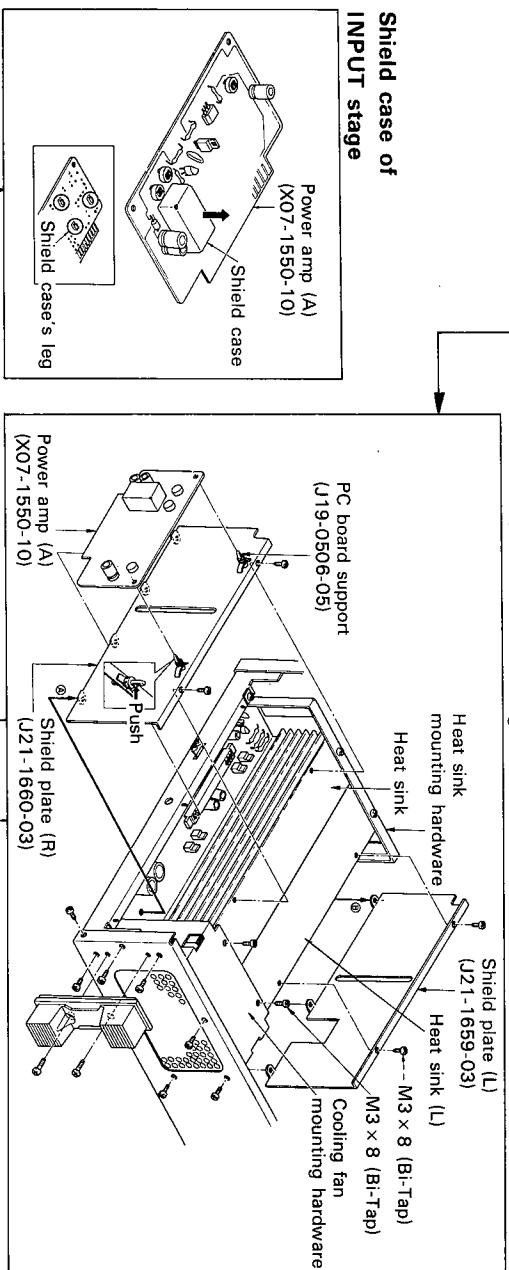

* Should remove the case, bottom plate, and meter shield case before disassembling for repair.

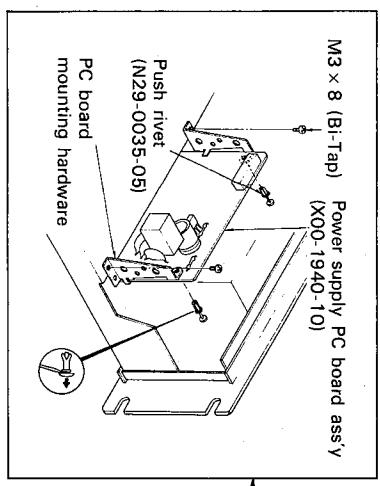

POWER AMP (X07-1550-10)

* When inserting the PC board, pay attention not to do forcedly.
* Shield plate (L) and (R) are mounted by the top and the bottom screws. (Refer to the next figure.)

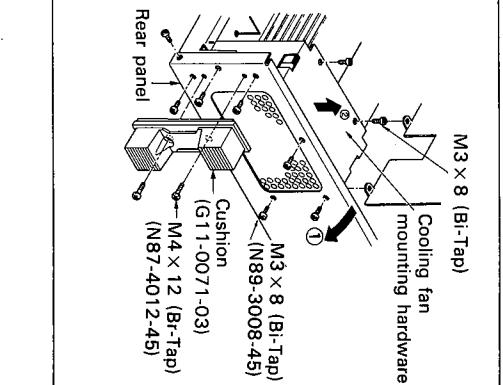

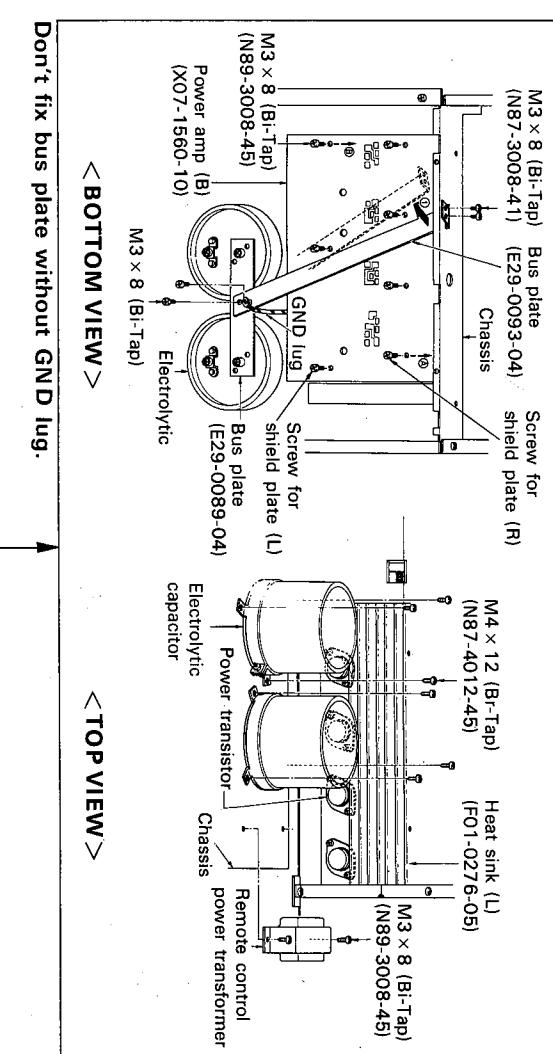

POWER SUPPLY
Power supply PC board ass'y is mounted by PC board mounting hardware with push rivets.

POWER TRANSISTOR (Q9 ~ 12)

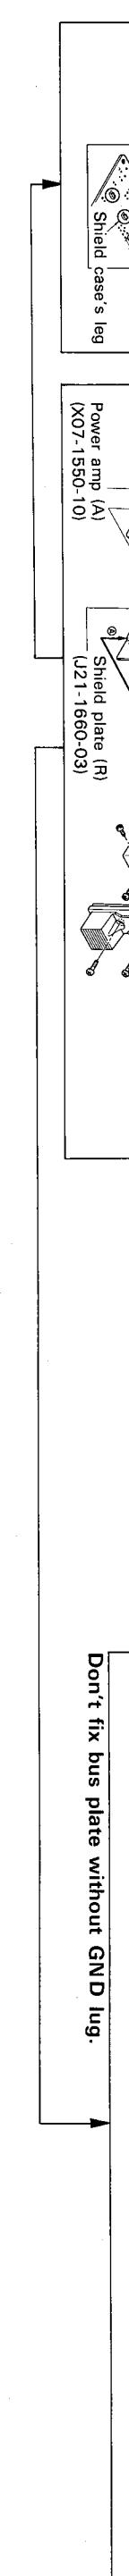

When replace the power transistors (Q9 ~ 12), remove electrolytic capacitor and remote control power transformer.

Don't fix bus plate without GND lug.

L-09M

BLOCK DIAGRAM/CIRCUIT DESCRIPTION

CIRCUIT DESCRIPTION

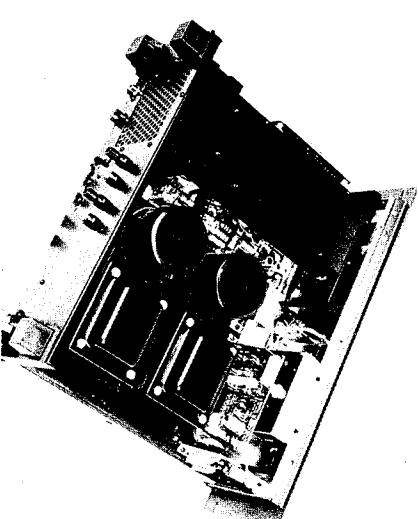

3. Rear Panel

A heat sink and power transistors are located on the left side and a power supply on the right side.

The model may also be used as a public amplifier because of its high output power (300W). The use of a direct reading watt meter and a clipping indicator enables monitoring of power. The meter ranges can be selected in 3 steps so that the meter deflects even with a small output. The meter has output ranges for both 4-ohms and 8-ohms.

5. Internal View

6. Power Supply PC board ass'y

On the rear panel there are a fan, input terminal, GND terminal, terminals for large size speakers, remote power switch and remote jack. The input phono jack is gold plated to prevent poor contacts. This jack is of the self-locked type so that the audio cord is not disconnected accidentally. Note that if the audio cord is disconnected while in use, the result may be damage to the speaker due to a large output. With the remote switch set to the MANUAL position, the power can be turned on and off by the power switch on the front panel. If it is desired to control the power remotely from L-07C, this switch should be set to the REMOTE position. On the panel there are two remote terminals for driving as multi-amp system.

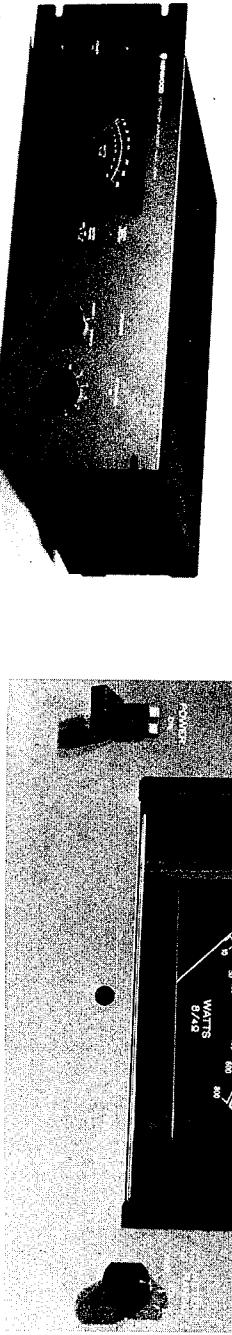

Since the amplifier delivers a high output power, it requires highly efficient ventilation. To ensure proper ventilation, it is provided with a fan and large sized heat sink. The fan is designed to be switched automatically.

4. Cooling Fan

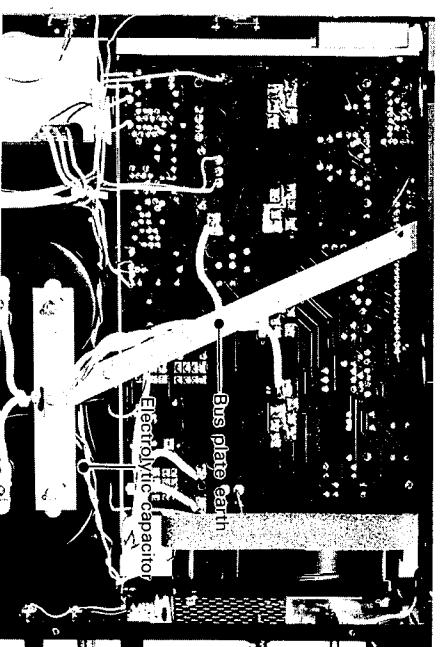

INTRODUCTION TO L-09M
Model L-09M is designed to deliver high output power up to 300W. This model is equipped with a large sized power meter and a clipping level indicator to permit monitoring of output level. Two pairs of speaker system, A and B, can be connected for selective use according to application. The input circuit is provided with an attenuator so that the speakers can be driven from any type of preamplifier. Because of a high output power amplifier, selected parts are used in the circuits to ensure high reliability.

1. Panel

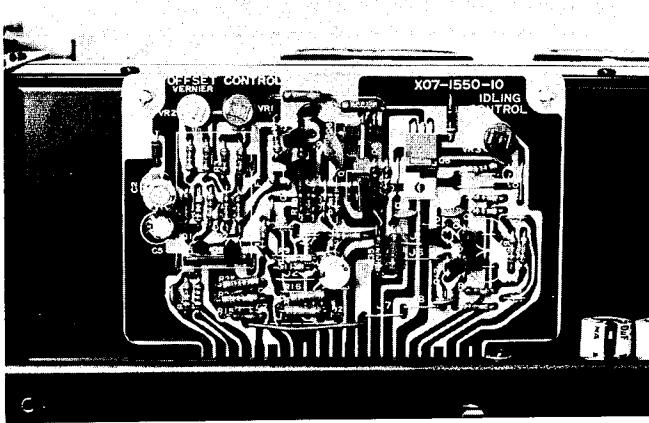

Since the amplifier delivers a high output power, it requires highly efficient ventilation. To ensure proper ventilation, it is provided with a fan and large sized heat sink. The fan is designed to be switched automatically.

CIRCUIT DESCRIPTION

The power supply includes a large capacity electrolytic capacitors based on the KENWOOD's dynamic crosstalk theory and a bus plate earth line to reduce the impedance.

7. Power Amplifier

The power amplifier is a series-parallel push-pull, ICL OCL DC amplifier of pure complementary series, featuring FET differential amplifier and Darlington connection plus 3-stage differential circuit and constant current circuit. The input stage is composed of a one-chip dual FET having high impedance and excellent thermal characteristic. It features a constant current circuit and cascode circuit to improve the stability. Sufficient loop gain is assured by the constant current circuit used as a pre-driver in the third stage differential amplifier. The darlington power circuit includes a series of push-pull driver, a series-parallel push-pull power transistors operated on low voltage to reduce the current by half. The use of selected parts has also improved the reliability. The power transistors provide excellent linearity over the high frequency range and perfectly matched characteristics, thus minimizing the distortion which normally occur in high output power amplifiers.

Series-Parallel Connection

The power amplifier of L-09M delivers a high output (300W) so the power transistors are driven by a special circuit. The relationship between output power and power supply voltage is normally expressed by the following formula:

$$P_{O \max} = \frac{V_{CC}^2}{8 \times RL}$$

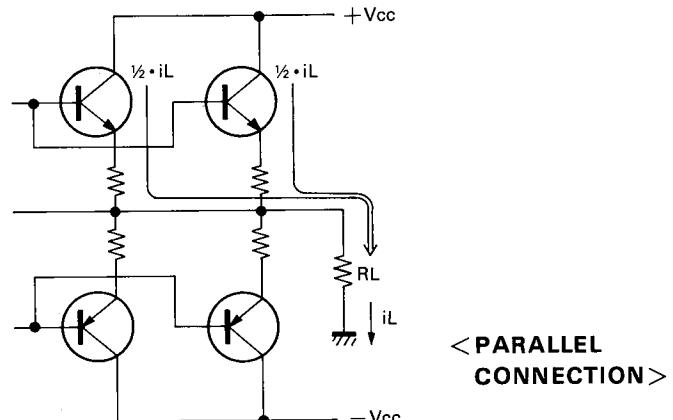

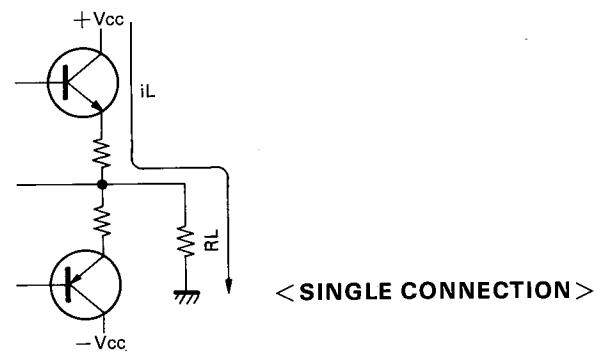

RL = Load

$P_{O \max}$ = Maximum output

If we get high power output, as will be understood from the above formula, either the load should be reduced or V_{CC} should be increased. Most of speakers available from markets are rated at 8 to 16 ohms, and 8 ohm speakers are usually used for transistor amplifiers. Therefore, the value of V_{CC} needs to be increased. Today, power transistors which have excellent withstand voltage and switching characteristics are limited and hardly obtained. Accordingly, a series-parallel connection system has been employed to improve the V_{CE} characteristic and reduce the load of each power transistor. Parallel connection system has been used in power amplifiers for a long time, and this system is normally called the parallel push-pull or triple push-pull system. Output power varies directly with the current flowing into the load as shown in the formula below:

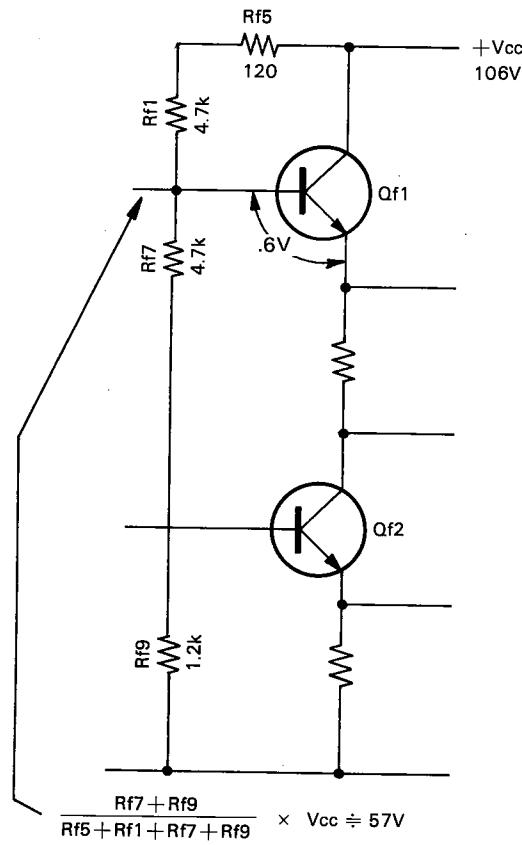

$$P_{O \max} = iL^2 \times RL \quad iL = \text{Current flow to load}$$

Since the output power of L-09M is as high as 300W, the power transistors cannot be driven properly by single complementary power transistors circuit (PNP and NPN). The use of parallel connection circuit will reduce "iL" of each transistor.

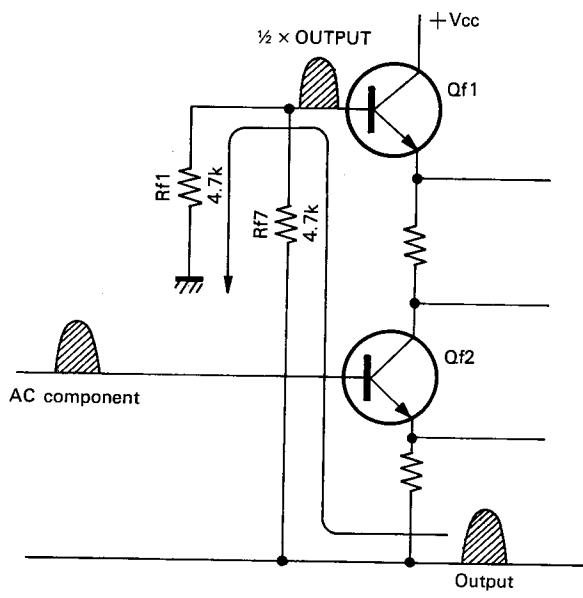

CIRCUIT DESCRIPTION

The series connection system was used in the early times of transistor amplifier circuits. The power transistors in its early times were not suitable for high power amplifiers because of low V_{CEO} and the series connection system was sometimes employed for increasing output power.

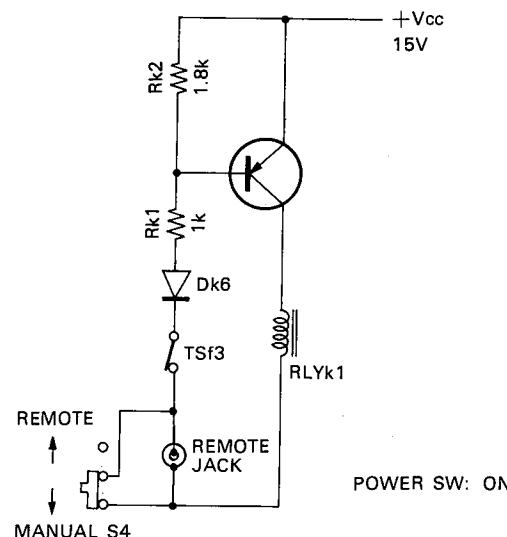

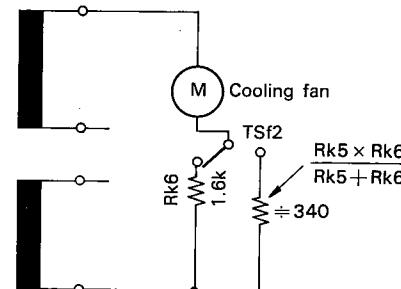

<DC QUIESCENT OPERATING CONDITION>

<AC OPERATING CONDITION>

Temperature Sensor

In the schematic diagram, TSF2 and TSF3 represent temperature sensors. Since L-09M is a high power amplifier that delivers 300W output, it incorporates a cooling fan to prevent temperature rise and to ensure stabilized operation. Temperature sensor has two types; one is the make type shown by TSF2 and the other is the break type shown by TSF3. If the temperature inside the case increases during operation, the temperature sensor TSF2 (70°C make type) mounted on the heat sink is activated.

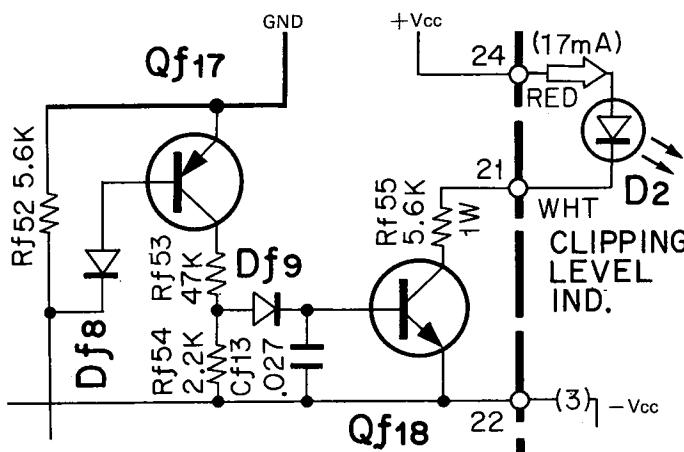

When TSF2 is activated, the value of the resistor in series with the cooling fan is varied, causing the fan to run faster. However, if the temperature of the heat sink increases further, TSF3 (90°C break type) is activated, turning off Qf1 of the power supply unit to shut off the power supply to the amplifier. The temperature sensor is of the automatic reset type; it is reset as the temperature lowers.

CIRCUIT DESCRIPTION

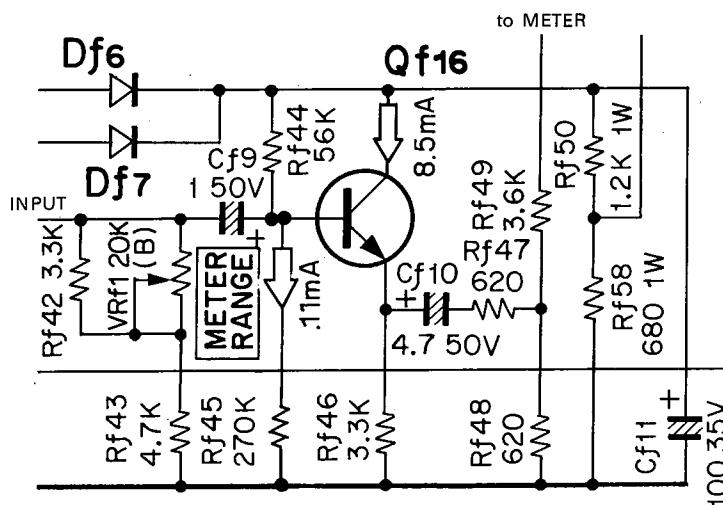

Clipping Indicator Circuit

Qf17 at the input stage of the clipping indicator circuit is usually reverse biased. Like Qf18, it is in OFF state and LED of the indicator remains OFF. If a large input signal is fed to the amplifier, the collector voltage of Qe6 at the third stage of the differential amplifier is lowered, causing Qf17 to be forward biased. Since Qf17 turns to ON, the voltage drop across Rf54 is increased due to the collector current and thus Qf18 turns to ON and LED D2 lights up, in turn.

Meter Amplifier Circuit

The meter amplifier Qf16 is an emitter-follower, high input impedance circuit to minimize the effect of the output stage. The output is attenuated by a resistor and is fed to the meter amplifier. The power supply to Qf16 is separated from that to the power amplifier.

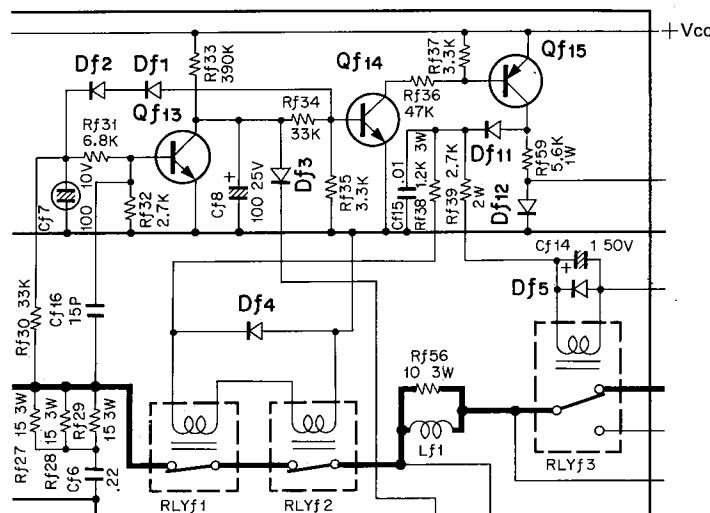

DC Protection

The DC potential at the output terminal (speaker terminal) is always maintained at zero volt by the positive and negative power supply circuits and the differential amplifier. However, if a DC potential appears for a certain reason, the differential amplifier cannot reduce this potential to zero volt and DC current flows into the speaker load which is therefore destroyed. Hence, the DC protection circuit is installed. If a DC potential is generated and cannot be compensated by the differential amplifier, the DC protection circuit actuates a relay to separate the load (speaker) from the load circuit to protect it against destruction.

Assume that there is a DC potential at the output terminal and cannot be compensated by the differential amplifier. Then current begins to flow through Rf30 and Cf7 is charged. If they are positively charged, the base potential rises at Qf13 which is therefore turned on. When Qf13 is turned on, the collector potential of Qf13 is lowered and the base voltage of Qf14 is also lowered and then Qf15 is raised. Thus Qf14 and Qf15 are turned off and the relay separates the load from the circuit. If Cf7 is negatively charged, the diodes Df1 and 2 are biased in the forward direction to lower the base potential of Qf14. Thus Qf14 and Qf15 are turned off and the relay also functions to separate the load from the circuit.

This DC protection circuit is devised to prevent shock noise which may occur after power switch is on. When the power supply circuit is switched on, +Vcc current flows through Rf33 and Cf8. The relay remains to separate the load until Cf8 is charged up, since the base potential at Qf14 is not raised. When Cf8 is completely charged, Qf14 is turned on and the relay is set. No shock noise occurs since this time period (dependent on the time constant of Rf33 and Cf8) is longer than the circuit stabilizing time after power switch is on.

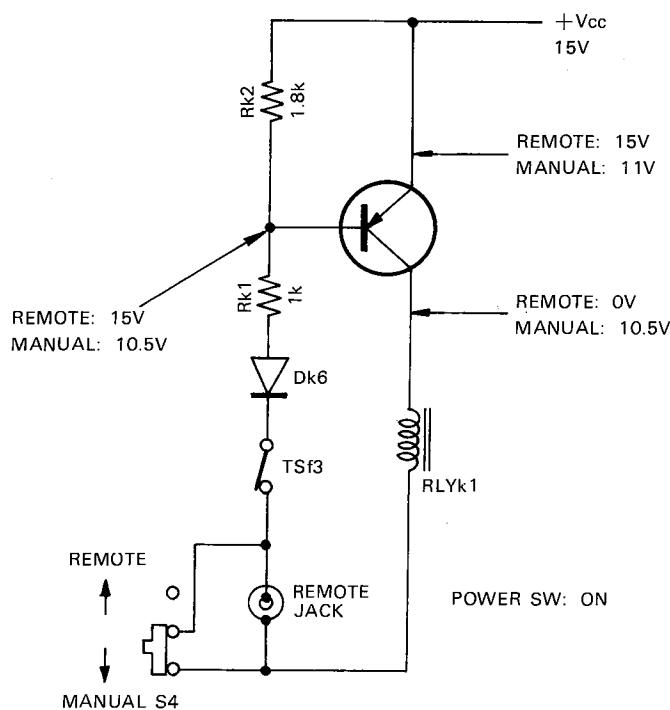

CIRCUIT DESCRIPTION

Remote Circuit

It is also possible L-09M is located near the speaker system. Then there is much distance between the power amplifier and the control amplifier, L-07C, and switching on and off the L-09M unit is very troublesome. Hence this remote circuit is devised. The remote circuit enables the L-09M unit to be switched on and off through a remote cord simultaneously when the L-07C unit is switched on and off. The circuit diagram of the remote circuit is shown below.

When S4 (or the reed relay of L-07C) is short-circuited, voltage is applied to the base of Qk1, which is therefore turned on, the power relay operates. The power relay has the same function as for the power switch. In other words, the working of the power relay is equivalent to the switching on of the power switch.

When S4 (or the reed relay) is open, Qk1 is turned off since voltage is not applied to its base. Thus the power relay is released and also the power switch is OFF and power supply does not feed to the power amplifier.

TROUBLESHOOTING

This troubleshooting is written by data that we dare to misoperate semiconductors.

ADJUSTMENT

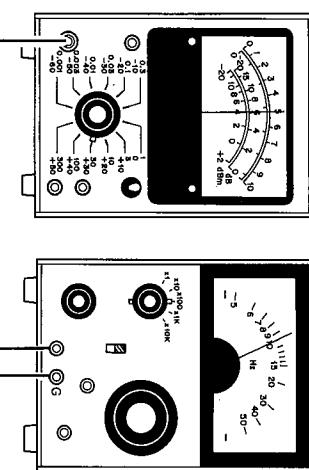

L-09M

SSVM

AG 1 kHz

VRe3

BIAS

METER RANGE

- (1) Connect the AG setting 1 kHz to INPUT jack and 8Ω dummy load to speaker terminal.
- (2) Connect SSVM across the dummy.
- (3) Set the meter range of L-09M to "x 0.1".
- (4) Attenuate the output of AG to 15.5V/ 8Ω with L-09M and AG of attenuator.
- (5) Turn the PC trimmer potentiometer VRf1 until the power meter indicates 300W reading.

SSVM

AG 1 kHz

VRe3

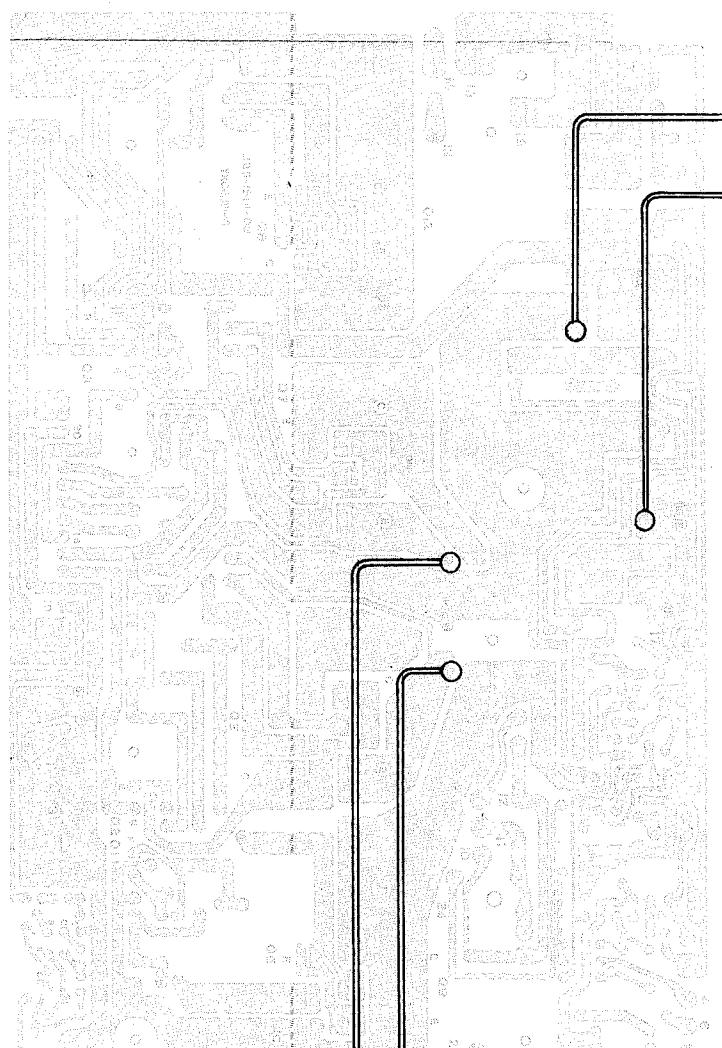

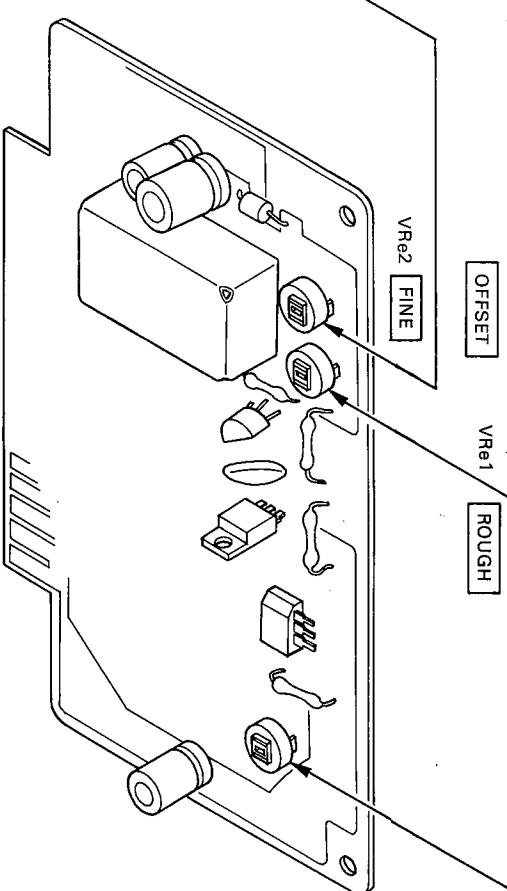

BIAS

OFFSET

- (1) Turn the PC trimmer potentiometer VRe2 (FINE) to its mechanical center.
- (2) Turn the potentiometer VRe1 (ROUGH) until bias current adjusting meter or VOM indicates OV.
- (3) Turn the potentiometer VRe2 until the VOM set to low range indicates OV.

BIA

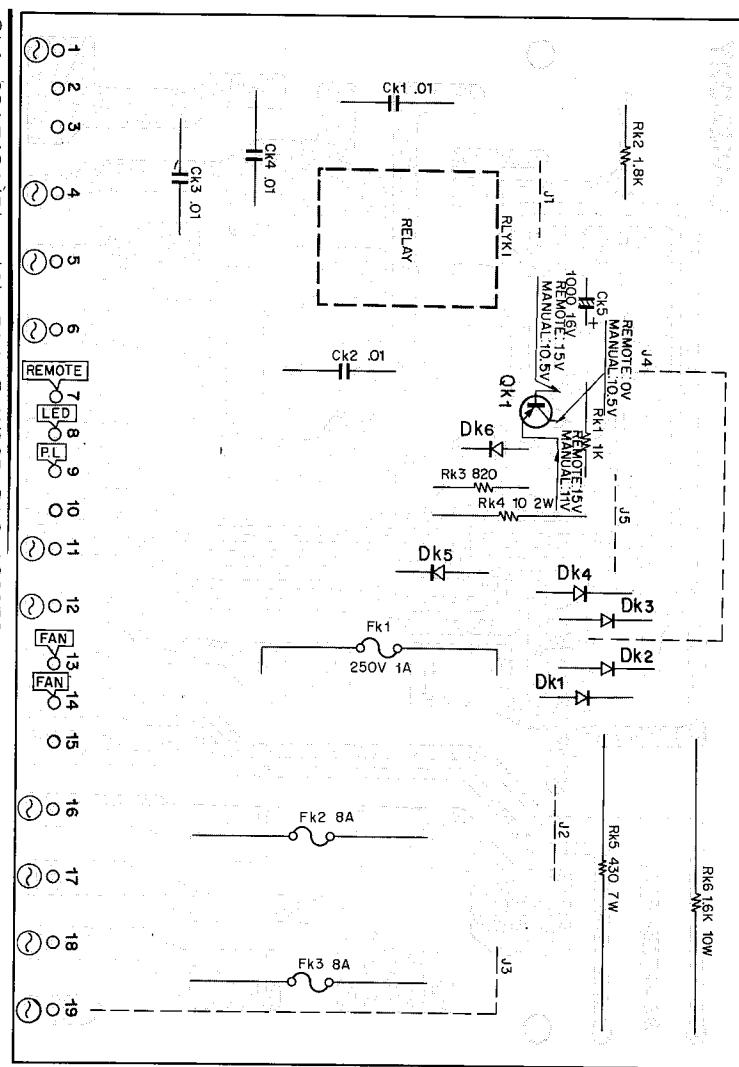

Turn the PC trimmer potentiometer VRe3 until the meter indicates 33mV.

▼ POWER SUPPLY (X00-1940-10)

Note: X00-1940-61 for Europe does not have Fk2, 3.
Negative line of remote control circuit (terminal #1)

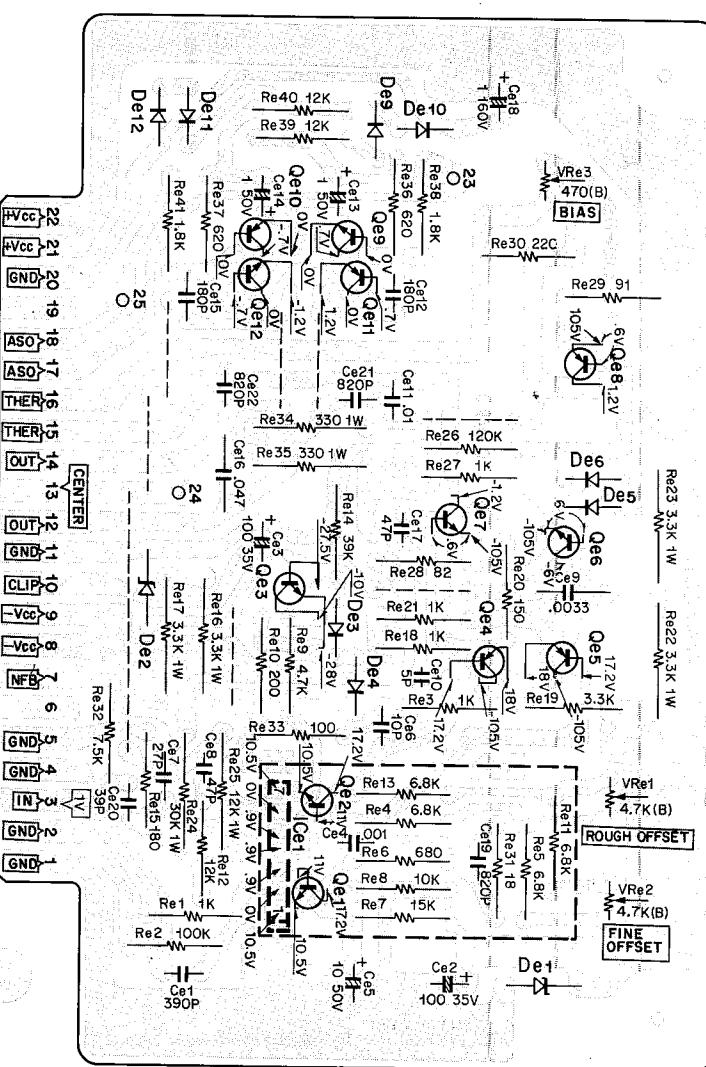

the chassis.

▼ POWER AMP (A) (X07-1550-10)

Caution: On the X00-1940-10, some unit of the first lot has difference between the schematic (right) and PC board (wrong) as following:

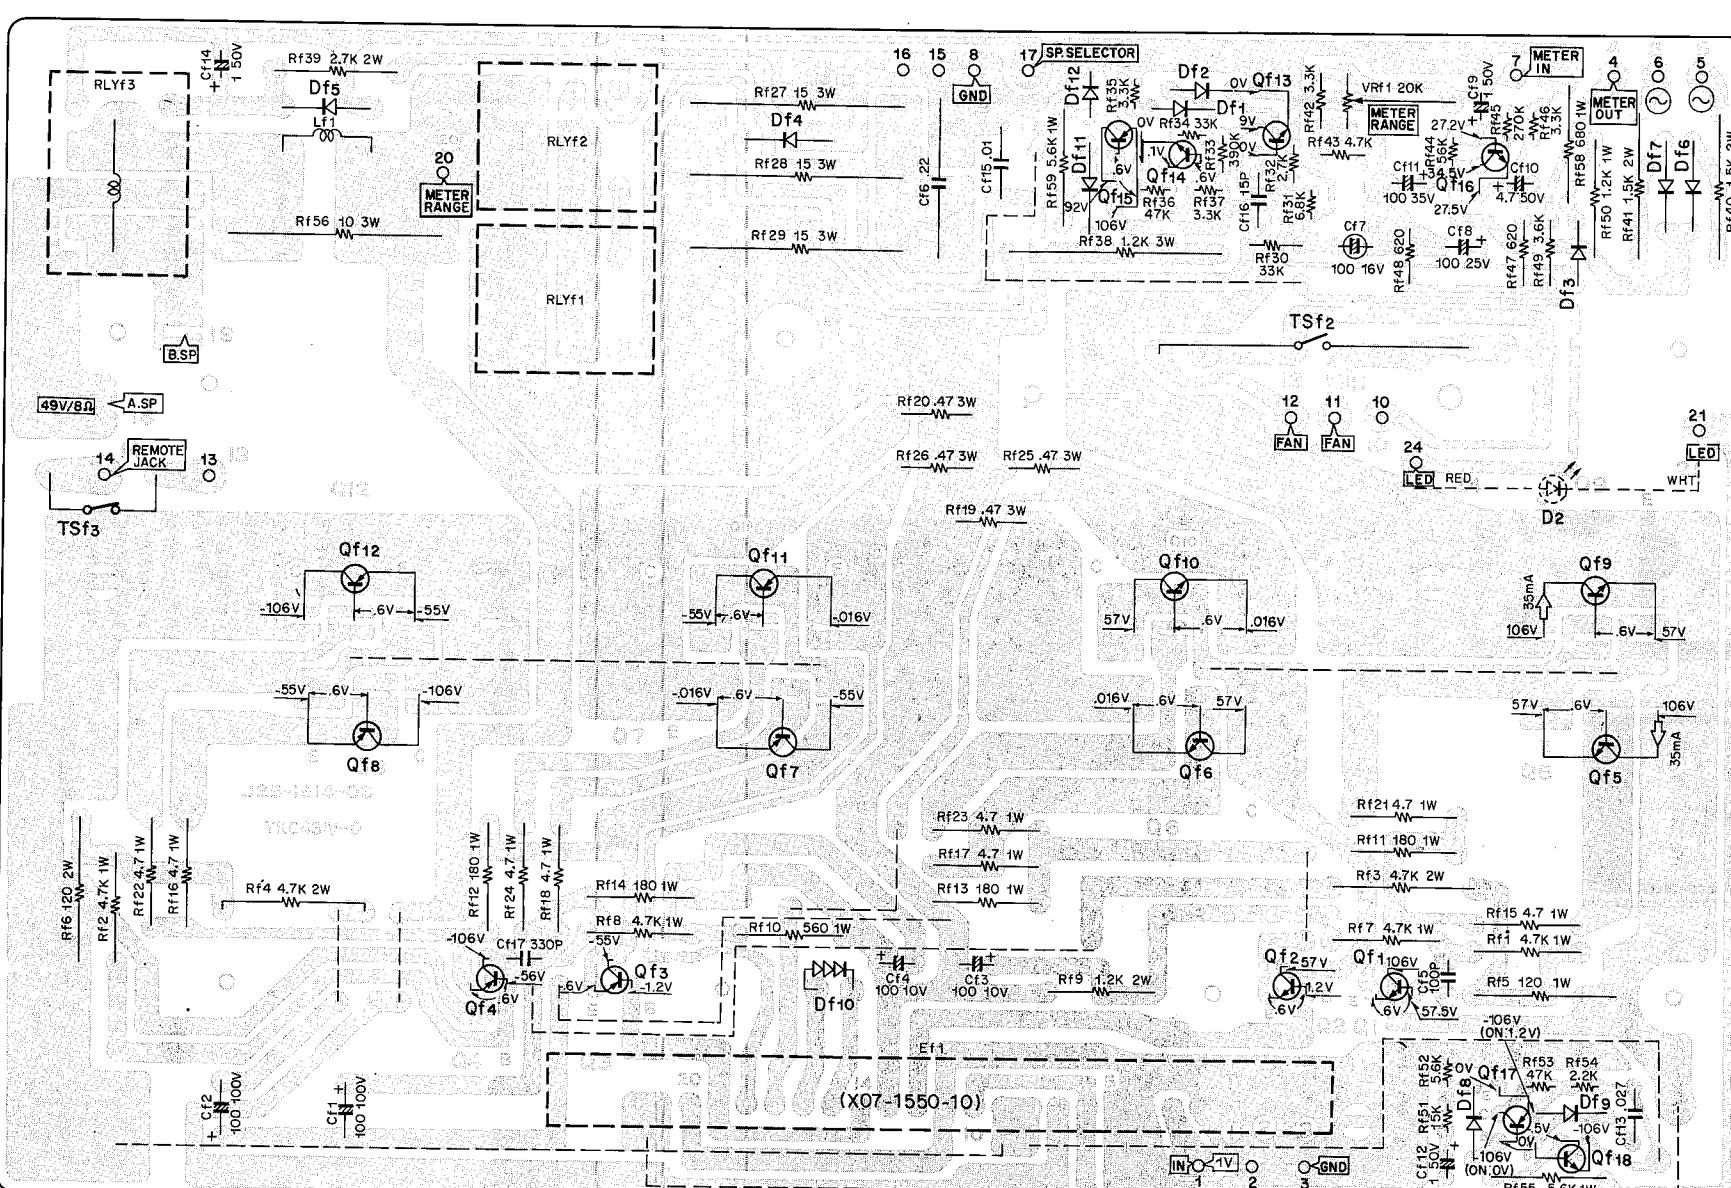

1. RND is installed to **#7** position.
 2. RK4 is installed to **R3** position.
 3. D3 is connected to #9 and #10 terminals.
 4. Pilot lamp is connected to #8 and #10 terminals.

PC BOARD

Note: When using 2SC1116(O) as Q15, 6, 9, 10, 2SA747(O), should be employed as Q17, 8, 11, 12, also when using 2SC1116(Y) as Qf6, 6, 9, 10, 2SA747(Y) should be done as Q17, 8, 11, 12.

SCHEMATIC DIAGRAM

SPECIFICATIONS

Model L-09M (Single Channel Power Amplifier)

Specifications described here are based on the measured values at the tip of the Special Speaker Cable provided, at its connection to Model L-09M.

PERFORMANCE

Power Output

300 watts* minimum power, RMS at 8 ohms from 20 Hz to 20,000 Hz with no more than 0.02% total harmonic distortion.

Continuous Power	300 watts 8 ohms at 1,000 Hz 400 watts 4 ohms at 1,000 Hz
Dynamic Power Output	1,000 watts 4 ohms at 1,000 Hz
Total Harmonic Distortion (T.H.D.)	0.02% at rated power output into 8 ohms 20 Hz ~ 20 kHz 0.01% at 30 watts into 8 ohms 20 Hz ~ 20 kHz 0.003% at rated power into 8 ohms 1 kHz 0.003% at 30 watts into 8 ohms 1 kHz 0.02% at rated power into 4 ohms 1 kHz 0.007% at rated power into 8 ohms
Intermodulation Distortion (60 Hz : 7 kHz = 4 : 1)	0.02% at rated power into 4 ohms
Frequency Response	DC ~ 50,000 Hz +0. -1.0 dB
Signal to Noise Ratio (IHF - A Curve)	DC ~ 100,000 Hz +0. -2.0 dB 120 dB (short-circuited)
Residual Noise (IHF - A Curve)	50 μ V
Damping Factor	200 into 8 ohms load
Input Sensitivity/Impedance	250 into 8 ohms load without Speaker Cable 1 V/50 k ohms
Speaker Impedance	Accept 4 ohms to 16 ohms
Speaker Cable Loss	0.01 ohms

GENERAL

Power Consumption	1,190 watts at full power 60 watts at non-signal
AC Outlet	1 UNSWITCHED (Maximum 200 watts)
Dimensions	W 18-29/32" (480 mm) H 6-16/32" (154 mm) D 16-1/8" (409.5 mm)
Weight (Net) (Gross)	47.2 lbs. (21.4 kg) 49.81 lbs. (22.6 kg)

* Measured pursuant to Federal Trade Commission's Trade Regulation rule in U.S.A. on Power Output Claims for Amplifier.

Note: Kenwood follows a policy of continuous advancements in development. For this reason specifications may be changed without notice.
